Chapter 1

SDK PREVIEW

- BLE APIs :
 - GAP APIs : ble GAP APIs
 - GATT APIs : ble GATT APIs
 - CM APIs : ble CM APIs
 - MSG APIs : ble MSG APIs
 - SMP APIs : ble SMP APIs
- WiFi APIs :
 - Station APIs : station APIs
 - Common APIs : common APIs
 - Enumerations : enumerations

Chapter 2

Module Index

2.1 Modules

Here is a list of all modules:

BLE ALL APIs	9
BLE CM APIs	10
BLE GAP APIs	17
BLE GATT APIs	39
BLE MSG APIs	73
BLE SMP APIs	85
WIFI APIs	93
WIFI Common APIs	99
WIFI STA APIs	102
Enumeration	144

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

_wpa_ie_data	149
asso_data	150
auto_conn_info_t	152
auto_connect_cfg_t	155
event_msg_t	
Send information to event by event_msg_t	157
hap_control_t	158
LE_BT_ADDR_T	159
LE_CM_CONNECTION_COMPLETE_IND_T	160
LE_CM_MSG_ADVERTISE_REPORT_IND_T	161
LE_CM_MSG_CONN_PARA_REQ_T	162
LE_CM_MSG_CONN_UPDATE_COMPLETE_IND_T	163
LE_CM_MSG_DATA_LEN_CHANGE_IND_T	164
LE_CM_MSG_DIRECT_ADV_REPORT_IND_T	165
LE_CM_MSG_DISCONNECT_COMPLETE_IND_T	166
LE_CM_MSG_ENCRYPTION_CHANGE_IND_T	167
LE_CM_MSG_ENCRYPTION_REFRESH_IND_T	168
LE_CM_MSG_INIT_COMPLETE_CFM_T	169
LE_CM_MSG_LTK_REQ_IND_T	169
LE_CM_MSG_READ_ADV_TX_POWER_CFM_T	170
LE_CM_MSG_READ_BD_ADDR_CFM_T	171
LE_CM_MSG_READ_CHANNEL_MAP_CFM_T	172
LE_CM_MSG_READ_PHY_CFM_T	172
LE_CM_MSG_READ_RESOLVING_LIST_SIZE_CFM_T	173
LE_CM_MSG_READ_RSSI_CFM_T	174
LE_CM_MSG_READ_TX_POWER_CFM_T	174
LE_CM_MSG_READ_WHITE_LIST_SIZE_CFM_T	175
LE_CM_MSG_SET_DATA_LENGTH_CFM_T	176
LE_CM_MSG_SET_DISCONNECT_CFM_T	176
LE_CM_MSG_SET_PHY_CFM_T	177
LE_CM_MSG_SIGNAL_UPDATE_REQ_T	178
LE_CM_REQ_STATUS_T	179
LE_CONN_PARA_T	179
LE_GAP_ADVERTISING_PARAM_T	180
LE_GAP_CONN_PARAM_T	181

LE_GAP_SCAN_PARAM_T	182
LE_GATT_ATTR_T	183
LE_GATT_MSG_ACCESS_READ_IND_T	185
LE_GATT_MSG_ACCESS_WRITE_IND_T	185
LE_GATT_MSG_CHAR_DESCRIPTOR_INFO_IND_T	187
LE_GATT_MSG_CHARACTERISTIC_DECL_INFO_IND_T	188
LE_GATT_MSG_CHARACTERISTIC_VAL_IND_T	189
LE_GATT_MSG_CONFIRMATION_CFM_T	191
LE_GATT_MSG_EXCHANGE_MTU_CFM_T	191
LE_GATT_MSG_EXCHANGE_MTU_IND_T	192
LE_GATT_MSG_EXECUTE_WRITE_RELIABLE_CFM_T	193
LE_GATT_MSG_FIND_ALL_CHAR_DESC_CFM_T	194
LE_GATT_MSG_FIND_ALL_PRIMARY_SERVICE_CFM_T	195
LE_GATT_MSG_FIND_CHARACTERISTIC_CFM_T	196
LE_GATT_MSG_FIND_INCLUDED_SERVICE_CFM_T	197
LE_GATT_MSG_FIND_PRIMARY_SERVICE_BY_UUID_CFM_T	198
LE_GATT_MSG_INCLUDE_SERVICE_INFO_IND_T	199
LE_GATT_MSG_INDICATE_IND_T	200
LE_GATT_MSG_NOTIFY_CFM_T	201
LE_GATT_MSG_NOTIFY_IND_T	202
LE_GATT_MSG_OPERATION_TIMEOUT_T	203
LE_GATT_MSG_PREPARE_WRITE_RELIABLE_CFM_T	204
LE_GATT_MSG_READ_CHAR_VAL_BY_UUID_CFM_T	205
LE_GATT_MSG_READ_CHARACTERISTIC_VALUE_CFM_T	206
LE_GATT_MSG_READ_LONG_CHAR_VAL_CFM_T	207
LE_GATT_MSG_READ_MULTIPLE_CHAR_VAL_CFM_T	208
LE_GATT_MSG_SERVICE_INFO_IND_T	209
LE_GATT_MSG_SIGNED_WRITE_CFM_T	210
LE_GATT_MSG_WRITE_CHAR_VAL_RELIABLE_CFM_T	211
LE_GATT_MSG_WRITE_CHAR_VALUE_CFM_T	212
LE_GATT_MSG_WRITE_LONG_CHAR_VALUE_CFM_T	213
LE_GATT_MSG_WRITE_NO_RSP_CFM_T	214
LE_GATT_SERVICE_T	215
LE_SMP_MSG_ENCRYPTION_CHANGE_IND_T	216
LE_SMP_MSG_ENCRYPTION_REFRESH_IND_T	217
LE_SMP_MSG_OOB_DATA_REQUEST_IND_T	217
LE_SMP_MSG_PAIRING_ACTION_IND_T	218
LE_SMP_MSG_PAIRING_COMPLETE_IND_T	219
LE_SMP_MSG_PASSKEY_DISPLAY_IND_T	220
LE_SMP_MSG_PASSKEY_INPUT_IND_T	220
LE_SMP_MSG_SC_OOB_DATA_REQUEST_IND_T	221
LE_SMP_MSG_SLAVE_SECURITY_REQUEST_IND_T	221
LE_SMP_MSG_USER_CONFIRM_IND_T	222
LE_SMP_SC_OOB_DATA_T	223
LE_SYS_MSG_BUF_OVERFLOW_T	223
mw_blewifi_cbs_store_t	224
mw_wifi_auto_connect_ap_info_t	224
mw_wifi_sta_info_t	227
MwFimAutoConnectCFG_t	228
rx_eapol_data	229
S_WIFI_MLME_SCAN_CFG	230
scan_info_t	231
scan_report_t	234
T_RfCmd	234
T_RfEvt	235
wifi_active_scan_time_t	
Range of active scan times per channel	237

wifi_ap_config_t	
This structure is the Wi-Fi configuration for initialization for Soft-AP mode	238
wifi_auto_connect_info_t	
This structure is the Wi-Fi auto connect for save in the flash (FIM)	240
wifi_cmd_t	242
wifi_config_t	
Wi-Fi configuration for initialization	243
wifi_event_info_t	
Wifi_event_info_t	244
wifi_event_sta_connected_t	
Wifi_event_sta_connected_t	245
wifi_event_sta_disconnected_t	
Wifi_event_sta_disconnected_t	246
wifi_event_sta_got_ip_t	247
wifi_event_sta_scan_done_t	
Wifi_event_sta_scan_done_t	247
wifi_evt_t	248
wifi_fast_scan_threshold_t	
Structure describing parameters for a Wi-Fi fast scan	249
wifi_init_config_t	
WiFi stack configuration parameters	249
wifi_scan_config_t	
Parameters for an SSID scan	250
wifi_scan_info_t	
This structure defines the inforamtion of scanned APs	251
wifi_scan_list_t	
This structure defines the list of scanned APs with their corresponding information	254
wifi_scan_time_t	
Aggregate of active & passive scan time per channel	254
wifi_sta_config_t	
This structure is the Wi-Fi configuration for initialization for STA mode	255
wifi_wpa_ie_data_t	
This structure is the Wi-Fi auto connect with wpa information for save in the flash (FIM)	257

Chapter 4

Module Documentation

4.1 BLE ALL APIs

BLE ALL APIs.

Modules

- [BLE CM APIs](#)
- [BLE GAP APIs](#)
- [BLE GATT APIs](#)
- [BLE MSG APIs](#)
- [BLE SMP APIs](#)

Functions

- `UINT8 LeSmpGetBondIdFromAddr (LE_BT_ADDR_T *peer_addr)`

4.1.1 Detailed Description

BLE ALL APIs.

4.1.2 Function Documentation

4.1.2.1 `LeSmpGetBondIdFromAddr()`

```
UINT8 LeSmpGetBondIdFromAddr (
    LE\_BT\_ADDR\_T * peer_addr )
```

4.2 BLE CM APIs

Data Structures

- struct [LE_CM_CONNECTION_COMPLETE_IND_T](#)
- struct [LE_CM_MSG_ADVERTISE_REPORT_IND_T](#)
- struct [LE_CM_MSG_CONN_PARA_REQ_T](#)

4.2.4 Function Documentation

4.2.4.1 LeCmInit()

```
void LeCmInit (
    TASK appTask )
```

BLE Connection Management Module Init.

Parameters

<i>the</i>	reference of BLE task.
------------	------------------------

Returns

None.

4.3 BLE GAP APIs

Functions

- `LE_ERR_STATE LeGapAddToResolvingList (LE_BT_ADDR_T *bt_addr, UINT8 *irk)`
Add device to resolving-list.
- `LE_ERR_STATE LeGapAddToWhiteList (LE_BT_ADDR_T *bt_addr)`
Add device to whitelist.
- `LE_ERR_STATE LeGapAdvertisingEnable (BOOL start)`
Enable or disable advertising function.
- `LE_ERR_STATE LeGapCentralConnectReq (LE_BT_ADDR_T *taddr, UINT8 own_addr_type)`
Central connect request.
- `LE_ERR_STATE LeGapCentralSetDataChannel (UINT8 *ch)`
Central set data channel.
- `LE_ERR_STATE LeGapClearResolvingList (void)`
Clear the resolving-list in the controller.
- `LE_ERR_STATE LeGapClearWhiteList (void)`
Clear whitelist in the controller.
- `LE_ERR_STATE LeGapConnectCancelReq (void)`
Cancel connect request.
- `void LeGapConnParaRequestRsp (UINT16 conn_hdl, BOOL accept)`
Connection parameters request response.
- `LE_ERR_STATE LeGapConnUpdateRequest (UINT16 conn_hdl, LE_CONN_PARA_T *para)`
Connection parameters update request.
- `void LeGapConnUpdateResponse (UINT16 conn_hdl, UINT8 identifier, BOOL accept)`
Connection parameters update response.
- `LE_ERR_STATE LeGapDisconnectReq (UINT16 conn_hdl)`
Disconnect the physical connection.
- `LE_ERR_STATE LeGapGenRandAddr (UINT8 type, BD_ADDR addr)`
Called to generation random address.
- `void LeGapGetBtAddr (void)`
Get owner device address.
- `void LeGapReadAdvChannelTxPower (void)`
Read ADV channel txpower.
- `LE_ERR_STATE LeGapReadChannelMap (UINT16 conn_hdl)`
Read channel map.
- `LE_ERR_STATE LeGapReadPhy (UINT16 conn_hdl)`
- `void LeGapReadResolvingListSize (void)`
Read the resolving-list size in the controller.
- `LE_ERR_STATE LeGapReadRssi (UINT16 conn_hdl)`
Read RSSI value from controller.
- `LE_ERR_STATE LeGapReadTxPower (UINT16 conn_hdl, UINT8 type)`
Read tx power value for the specified connection.

- void [LeGapReadWhiteListSize](#) (void)
Read whitelist size in the controller.
- LE_ERR_STATE [LeGapRemoveFromWhiteList](#) (LE_BT_ADDR_T *bt_addr)
Remove device from whitelist.
- LE_ERR_STATE [LeGapScanningReq](#) (BOOL start, BOOL filter)
Request scanning start.
- LE_ERR_STATE [LeGapSetAdvData](#) (UINT8 len, UINT8 *data)
Called to set ADV data.
- LE_ERR_STATE [LeGapSetAdvParameter](#) (LE_GAP_ADVERTISING_PARAM_T *params)
Called to set ADV parameters.
- LE_ERR_STATE [LeGapSetConnParameter](#) (UINT16 interval_min, UINT16 interval_max, UINT16 slave_latency, UINT16 supervision_timeout)
Called to set connection parameters.
- LE_ERR_STATE [LeGapSetDataChannelPduLen](#) (UINT16 conn_hdl, UINT16 tx_octets, UINT16 tx_time)
Set data channel PDU length.
- LE_ERR_STATE [LeGapSetDefaultPhy](#) (UINT8 tx, UINT8 rx)
- LE_ERR_STATE [LeGapSetPhy](#) (UINT16 conn_hdl, UINT8 tx, UINT8 rx, UINT16 option)
- LE_ERR_STATE [LeGapSetRandAddr](#) (BD_ADDR addr)
Called to set random address.
- LE_ERR_STATE [LeGapSetRpaTimeout](#) (UINT16 timeout)
Set resolvable private address timeout.
- LE_ERR_STATE [LeGapSetStaticAddr](#) (BD_ADDR addr)
Called to set static address.
- LE_ERR_STATE [LeSetScanParameter](#) (LE_GAP_SCAN_PARAM_T *params)
Called to set scan parameters.
- LE_ERR_STATE [LeSetScanRspData](#) (UINT8 len, UINT8 *data)
Called to set scan response data.

4.3.1 Detailed Description

4.3.2 Macro Definition Documentation

4.3.2.1 GAP_ADTYPE_128BIT_COMPLETE

```
#define GAP_ADTYPE_128BIT_COMPLETE 0x07
```

4.3.2.2 GAP_ADTYPE_128BIT_MORE

```
#define GAP_ADTYPE_128BIT_MORE 0x06
```

4.3.2.3 GAP_ADTYPE_16BIT_COMPLETE

```
#define GAP_ADTYPE_16BIT_COMPLETE 0x03
```

4.3.2.4 GAP_ADTYPE_16BIT_MORE

```
#define GAP_ADTYPE_16BIT_MORE 0x02
```

4.3.2.5 GAP_ADTYPE_32BIT_COMPLETE

```
#define GAP_ADTYPE_32BIT_COMPLETE 0x05
```

4.3.2.6 GAP_ADTYPE_32BIT_MORE

```
#define GAP_ADTYPE_32BIT_MORE 0x04
```

4.3.2.7 GAP_ADTYPE_3D_INFO_DATA

```
#define GAP_ADTYPE_3D_INFO_DATA 0x3D
```

4.3.2.8 GAP_ADTYPE_ADV_INTERVAL

```
#define GAP_ADTYPE_ADV_INTERVAL 0x1A
```

4.3.2.9 GAP_ADTYPE_APPEARANCE

```
#define GAP_ADTYPE_APPEARANCE 0x19
```

4.3.2.10 GAP_ADTYPE_FLAGS

```
#define GAP_ADTYPE_FLAGS 0x01
```

4.3.2.11 GAP_ADTYPE_FLAGS_BREDR_NOT_SUPPORTED

```
#define GAP_ADTYPE_FLAGS_BREDR_NOT_SUPPORTED 0x04
```

4.3.2.12 GAP_ADTYPE_FLAGS_GENERAL

```
#define GAP_ADTYPE_FLAGS_GENERAL 0x02
```

4.3.2.13 GAP_ADTYPE_FLAGS_LIMITED

```
#define GAP_ADTYPE_FLAGS_LIMITED 0x01

```
#define LE_GAP_ADV_MAX_SIZE 31
```

4.3.3 Function Documentation

4.3.3.1 LeGapAddToResolvingList()

```
LE_ERR_STATE LeGapAddToResolvingList (
    LE_BT_ADDR_T * bt_addr,
    UINT8 * irk )
```

Add device to resolving-list.

Parameters

<i>bt_addr</i>	BT device address.
<i>irk</i>	IRK, Identity Resolving Key

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.2 LeGapAddToWhiteList()

```
LE_ERR_STATE LeGapAddToWhiteList (
    LE_BT_ADDR_T * bt_addr )
```

Add device to whitelist.

Parameters

<i>bt_addr</i>	BT device address.
----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.3 LeGapAdvertisingEnable()

```
LE_ERR_STATE LeGapAdvertisingEnable (
    BOOL start )
```

Enable or disable advertising function.

Parameters

<i>start</i>	TRUE is enable, FALSE is disable.
--------------	-----------------------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.4 LeGapCentralConnectReq()

```
LE_ERR_STATE LeGapCentralConnectReq (
    LE_BT_ADDR_T * taddr,
    UINT8 own_addr_type )
```

Central connect request.

Parameters

<i>taddr</i>	advertisers device address.
<i>own_addr_type</i>	owner address type.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.5 LeGapCentralSetDataChannel()

```
LE_ERR_STATE LeGapCentralSetDataChannel (
    UINT8 * ch )
```

Central set data channel.

Parameters

<i>ch</i>	data channel.
-----------	---------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.6 LeGapClearResolvingList()

```
LE_ERR_STATE LeGapClearResolvingList (  
    void )
```

Clear the resolving-list in the controller.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.7 LeGapClearWhiteList()

```
LE_ERR_STATE LeGapClearWhiteList (  
    void )
```

Clear whitelist in the controller.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.8 LeGapConnectCancelReq()

```
LE_ERR_STATE LeGapConnectCancelReq (  
    void )
```

Cancel connect request.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.9 LeGapConnParaRequestRsp()

```
void LeGapConnParaRequestRsp (  
    UINT16 conn_hdl,  
    BOOL accept )
```

Connection parameters request response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>accept</i>	TRUE is accept, FALSE is not.

Returns

None.

4.3.3.10 LeGapConnUpdateRequest()

```
LE_ERR_STATE LeGapConnUpdateRequest (
    UINT16 conn_hdl,
    LE_CONN_PARA_T * para )
```

Connection parameters update request.

Parameters

<i>conn_hdl</i>	connection handle.
<i>para</i>	update connection parameters.

Returns

None.

4.3.3.11 LeGapConnUpdateResponse()

```
void LeGapConnUpdateResponse (
    UINT16 conn_hdl,
    UINT8 identifier,
    BOOL accept )
```

Connection parameters update response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>identifier</i>	TBD
<i>accept</i>	accept request, or not.

Returns

None.

4.3.3.12 LeGapDisconnectReq()

```
LE_ERR_STATE LeGapDisconnectReq (
    UINT16 conn_hdl )
```

Disconnect the physical connection.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.13 LeGapGenRandAddr()

```
LE_ERR_STATE LeGapGenRandAddr (
    UINT8 type,
    BD_ADDR addr )
```

Called to generation random address.

Parameters

<i>type</i>	address type.
<i>addr</i>	address.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.14 LeGapGetBtAddr()

```
void LeGapGetBtAddr (
    void )
```

Get owner device address.

4.3.3.15 LeGapReadAdvChannelTxPower()

```
void LeGapReadAdvChannelTxPower (
    void )
```

Read ADV channel txpower.

4.3.3.16 LeGapReadChannelMap()

```
LE_ERR_STATE LeGapReadChannelMap (
    UINT16 conn_hdl )
```

Read channel map.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.17 LeGapReadPhy()

```
LE_ERR_STATE LeGapReadPhy (
    UINT16 conn_hdl )
```

4.3.3.18 LeGapReadResolvingListSize()

```
void LeGapReadResolvingListSize (
    void )
```

Read the resolving-list size in the controller.

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.19 LeGapReadRssi()

```
LE_ERR_STATE LeGapReadRssi (
    UINT16 conn_hdl )
```

Read RSSI value from controller.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.20 LeGapReadTxPower()

```
LE_ERR_STATE LeGapReadTxPower (
    UINT16 conn_hdl,
    UINT8 type )
```

Read tx power value for the specified connection.

Parameters

<i>conn_hdl</i>	connection handle.
<i>type</i>	current tx power, or maximum tx power. Don't support.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.21 LeGapReadWhiteListSize()

```
void LeGapReadWhiteListSize (
    void )
```

Read whitelist size in the controller.

4.3.3.22 LeGapRemoveFromWhiteList()

```
LE_ERR_STATE LeGapRemoveFromWhiteList (
    LE_BT_ADDR_T * bt_addr )
```

Remove device from whitelist.

Remove device from resolving-list.

Parameters

<i>bt_addr</i>	BT device address.
----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.23 LeGapScanningReq()

```
LE_ERR_STATE LeGapScanningReq (  
    BOOL start,  
    BOOL filter )
```

Request scanning start.

Parameters

<i>start</i>	TRUE is start, FALSE is not.
<i>filter</i>	scan policy, refer to <code>LE_HCI_SCAN_FILT_*</code> in ble_hci_if.h

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.24 LeGapSetAdvData()

```
LE_ERR_STATE LeGapSetAdvData (  
    UINT8 len,  
    UINT8 * data )
```

Called to set ADV data.

Parameters

<i>len</i>	ADV data length.
<i>data</i>	ADV data.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.25 LeGapSetAdvParameter()

```
LE_ERR_STATE LeGapSetAdvParameter (
    LE_GAP_ADVERTISING_PARAM_T * params )
```

Called to set ADV parameters.

Parameters

<i>params</i>	advertising params.
---------------	---------------------

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.26 LeGapSetConnParameter()

```
LE_ERR_STATE LeGapSetConnParameter (
    UINT16 interval_min,
    UINT16 interval_max,
    UINT16 slave_latency,
    UINT16 supervision_timeout )
```

Called to set connection parameters.

Parameters

<i>interval_min</i>	mininum connection interval.
<i>interval_max</i>	maxinum connection interval.
<i>slave_latency</i>	slave letency.
<i>supervision_timeout</i>	supervison timeout.

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.27 LeGapSetDataChannelPduLen()

```
LE_ERR_STATE LeGapSetDataChannelPduLen (
    UINT16 conn_hdl,
```

```
UINT16 tx_octets,  
UINT16 tx_time )
```

Set data channel PDU length.

Parameters

<i>tx_octets</i>	the maximum number of octets in the Payload field that the local device will send to the remote device.
<i>tx_time</i>	the maximum number of microseconds that the local device will take to transmit a PDU to the remote device.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.28 LeGapSetDefaultPhy()

```
LE_ERR_STATE LeGapSetDefaultPhy (  
    UINT8 tx,  
    UINT8 rx )
```

4.3.3.29 LeGapSetPhy()

```
LE_ERR_STATE LeGapSetPhy (  
    UINT16 conn_hdl,  
    UINT8 tx,  
    UINT8 rx,  
    UINT16 option )
```

4.3.3.30 LeGapSetRandAddr()

```
LE_ERR_STATE LeGapSetRandAddr (  
    BD_ADDR addr )
```

Called to set random address.

Parameters

<i>addr</i>	the random address which should be set.
-------------	---

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.31 `LeGapSetRpaTimeout()`

```
LE_ERR_STATE LeGapSetRpaTimeout (
    UINT16 timeout )
```

Set resolvable private address timeout.

Parameters

<i>timeout</i>	RPA_Timeout, measured in seconds.
----------------	-----------------------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.32 `LeGapSetStaticAddr()`

```
LE_ERR_STATE LeGapSetStaticAddr (
    BD_ADDR addr )
```

Called to set static address.

Parameters

<i>addr</i>	the static address which should be set.
-------------	---

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.33 `LeSetScanParameter()`

```
LE_ERR_STATE LeSetScanParameter (
    LE_GAP_SCAN_PARAM_T * params )
```

Called to set scan parameters.

Parameters

<i>params</i>	scan parameters.
---------------	------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.3.3.34 LeSetScanRspData()

```
LE_ERR_STATE LeSetScanRspData (
    UINT8 len,
    UINT8 * data )
```

Called to set scan response data.

Parameters

<i>len</i>	scan response data length.
<i>data</i>	scan response data.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

BLE GATT message id.

Functions

- `LE_ERR_STATE LeGattAccessReadRsp (UINT16 conn_hdl, UINT16 handle, UINT8 att_err)`
Gatt access read response.
- `LE_ERR_STATE LeGattAccessWriteRsp (UINT16 conn_hdl, UINT8 method, UINT16 handle, UINT8 att_err)`
Gatt access write response.
- `LE_ERR_STATE LeGattChangeAttrVal (LE_GATT_SERVICE_T *svc, UINT16 attrId, UINT16 len, void *val)`
Change attribute value.
- `LE_ERR_STATE LeGattCharValConfirmation (UINT16 conn_hdl)`
Prepare write characteristic value response.
- `LE_ERR_STATE LeGattCharValIndicate (UINT16 conn_hdl, UINT16 hdl, UINT16 len, UINT8 *pval)`
Gatt characteristic value indication.

- LE_ERR_STATE [LeGattCharValNotify](#) (UINT16 conn_hdl, UINT16 hdl, UINT16 len, UINT8 *pval)
Gatt characteristic value notification.
- LE_ERR_STATE [LeGattExchangeMtuReq](#) (UINT16 conn_hdl, UINT16 mtu)
Exchange MTU request.
- LE_ERR_STATE [LeGattExchangeMtuRsp](#) (UINT16 conn_hdl, UINT16 mtu)
Exchange MTU response.
- LE_ERR_STATE [LeGattExecuteWriteCharValReliable](#) (UINT16 conn_hdl, BOOL yesno)
Execute write characteristic value request.
- LE_ERR_STATE [LeGattFindAllCharacteristic](#) (UINT16 conn_hdl, UINT16 start_hdl, UINT16 end_hdl)
Find all characteristic.
- LE_ERR_STATE [LeGattFindAllCharDescriptor](#) (UINT16 conn_hdl, UINT16 start_hdl, UINT16 end_hdl)
Find all characteristic description.
- LE_ERR_STATE [LeGattFindAllPrimaryService](#) (UINT16 conn_hdl)
Find all primary service.
- LE_ERR_STATE [LeGattFindCharacteristicByUuid](#) (UINT16 conn_hdl, UINT16 start_hdl, UINT16 end_hdl, UINT8 format, UINT16 *uuid)
Find characteristic by UUID.
- LE_ERR_STATE [LeGattFindIncludedService](#) (UINT16 conn_hdl, UINT16 start_hdl, UINT16 end_hdl)
Find include service.
- LE_ERR_STATE [LeGattFindPrimaryServiceByUuid](#) (UINT16 conn_hdl, UINT8 format, UINT16 *uuid)
Find primary service by UUID.
- UINT16 [LeGattGetAttrHandle](#) (LE_GATT_SERVICE_T *svc, UINT16 attrId)
Get attribute handle.
- LE_ERR_STATE [LeGattGetAttrVal](#) (LE_GATT_SERVICE_T *svc, UINT16 attrId, UINT16 *len, void *val)
Get attribute value.
- UINT16 [LeGattGetAttrValLen](#) (LE_GATT_SERVICE_T *svc, UINT16 attrId)
Get the length of attribute value.
- UINT16 [LeGattGetAttrValMaxLen](#) (LE_GATT_SERVICE_T *svc, UINT16 attrId)
Get the max length of attribute value.
- void [LeGattInit](#) (TASK appTask)
BLE Gatt module init.
- LE_ERR_STATE [LeGattModifyAttrVal](#) (LE_GATT_SERVICE_T *svc, UINT16 attrId, UINT16 offset, UINT16 len, void *val)
Modify attribute value.
- LE_ERR_STATE [LeGattPrepareWriteCharValReliable](#) (UINT16 conn_hdl, UINT16 handle, UINT16 offset, UINT16 len, UINT8 *val)
Prepare write characteristic value request.
- LE_ERR_STATE [LeGattReadCharValByUuid](#) (UINT16 conn_hdl, UINT16 start_hdl, UINT16 end_hdl, UINT8 format, UINT16 *uuid)
Read a characteristic value by UUID.
- LE_ERR_STATE [LeGattReadCharValue](#) (UINT16 conn_hdl, UINT16 handle)
Read a characteristic value.
- LE_ERR_STATE [LeGattReadLongCharVal](#) (UINT16 conn_hdl, UINT16 handle, UINT16 offset)
Read a long characteristic value.
- LE_ERR_STATE [LeGattReadMultipleCharVal](#) (UINT16 conn_hdl, UINT16 count, UINT16 *handle)
Read Multiple characteristic values.
- LE_ERR_STATE [LeGattRegisterIncludeService](#) (UINT16 inc_hdl, UINT16 start_hdl, UINT16 end_hdl, UI↔NT16 uuid)
Called to register an include service.
- LE_GATT_SERVICE_T * [LeGattRegisterService](#) (LE_GATT_ATTR_T *attrTable, UINT16 numAttr)
Called to register a service.

- LE_ERR_STATE [LeGattSignedWriteNoRsp](#) (UINT16 conn_hdl, UINT16 handle, UINT16 len, UINT8 *val)
Signed write without response.
- void [LeGattStopCurrentProcedure](#) (UINT16 conn_hdl)
Stop current procedure.
- LE_ERR_STATE [LeGattWriteCharVal](#) (UINT16 conn_hdl, UINT16 handle, UINT16 len, UINT8 *val)
Write characteristic value.
- LE_ERR_STATE [LeGattWriteCharValReliable](#) (UINT16 conn_hdl, UINT16 handle, UINT16 offset, UINT16 len, UINT8 *val)
Write characteristic value reliable.
- LE_ERR_STATE [LeGattWriteLongCharVal](#) (UINT16 conn_hdl, UINT16 handle, UINT16 offset, UINT16 len, UINT8 *val)
Write long characteristic value.
- LE_ERR_STATE [LeGattWriteNoRsp](#) (UINT16 conn_hdl, UINT16 handle, UINT16 len, UINT8 *val)
Write without response.

4.4.1 Detailed Description

4.4.2 Macro Definition Documentation

4.4.2.1 CHARAggregateDescriptor

```
#define CHARAggregateDescriptor(  
    len,  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharAggregateUuid, LE_GATT_PERMIT_READ,  
0, len, (UINT8 *) (pVal)}
```

4.4.2.2 CHAR_CLIENT_CONFIG_DESCRIPTOR

```
#define CHAR_CLIENT_CONFIG_DESCRIPTOR(  
    permit,  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcClientCharConfigUuid, LE_GATT_PERMIT_READ  
| permit, 0, 2, (UINT8 *) (pVal)}
```

4.4.2.3 CHAR_DECL_UUID16_ATTR_VAL

```
#define CHAR_DECL_UUID16_ATTR_VAL(  
    prop,  
    type ) {(prop), 0, 0, UINT16_LO(type), UINT16_HI(type)}
```

4.4.2.4 CHAR_EXT_PROP_DESCRIPTOR

```
#define CHAR_EXT_PROP_DESCRIPTOR(  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharExtPropUuid, LE_GATT_PERMIT_READ, 0,  
2, (UINT8 *) (pVal)}
```

4.4.2.5 CHAR_PRESENT_FORMAT_DESCRIPTOR

```
#define CHAR_PRESENT_FORMAT_DESCRIPTOR(  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharFormatUuid, LE_GATT_PERMIT_READ, 0,  
7, (UINT8 *) (pVal)}
```

4.4.2.6 CHAR_SERVER_CONFIG_DESCRIPTOR

```
#define CHAR_SERVER_CONFIG_DESCRIPTOR(  
    permit,  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcServerCharConfigUuid, LE_GATT_PERMIT_READ  
| permit, 0, 2, (UINT8 *) (pVal)}
```

4.4.2.7 CHAR_USER_DESC_DESCRIPTOR

```
#define CHAR_USER_DESC_DESCRIPTOR(  
    permit,  
    maxLen,  
    len,  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharUserDescUuid, permit, maxLen, len,  
(UINT8 *) (pVal)}
```

4.4.2.8 CHARACTERISTIC_DECL_UUID128

```
#define CHARACTERISTIC_DECL_UUID128(  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharacteristicUuid, LE_GATT_PERMIT_READ,  
    0, 19, (UINT8 *) (pVal)}
```

4.4.2.9 CHARACTERISTIC_DECL_UUID16

```
#define CHARACTERISTIC_DECL_UUID16(  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)&gcCharacteristicUuid, LE_GATT_PERMIT_READ,  
    0, 5, (UINT8 *) (pVal)}
```

4.4.2.10 CHARACTERISTIC_UUID128

```
#define CHARACTERISTIC_UUID128(  
    pUuid,  
    permit,  
    maxLen,  
    len,  
    pVal ) {0, LE_GATT_UUID128, (UINT16 *)pUuid, permit, maxLen, len, (UINT8 *) (p←  
Val)}
```

4.4.2.11 CHARACTERISTIC_UUID16

```
#define CHARACTERISTIC_UUID16(  
    pUuid,  
    permit,  
    maxLen,  
    len,  
    pVal ) {0, LE_GATT_UUID16, (UINT16 *)pUuid, permit, maxLen, len, (UINT8 *) (pVal)}
```

4.4.2.12 GATT_CHAR_AGG_FORMAT_UUID

```
#define GATT_CHAR_AGG_FORMAT_UUID 0x2905
```

4.4.2.13 GATT_CHAR_EXT_PROPS_UUID

```
#define GATT_CHAR_EXT_PROPS_UUID 0x2900
```

4.4.2.14 GATT_CHAR_FORMAT_UUID

```
#define GATT_CHAR_FORMAT_UUID 0x2904
```

4.4.2.15 GATT_CHAR_USER_DESC_UUID

```
#define GATT_CHAR_USER_DESC_UUID 0x2901
```

4.4.2.16 GATT_CHARACTERISTIC_UUID

```
#define GATT_CHARACTERISTIC_UUID 0x2803
```

4.4.2.17 GATT_CLIENT_CHAR_CFG_UUID

```
#define GATT_CLIENT_CHAR_CFG_UUID 0x2902
```

4.4.2.18 GATT_EXT_REPORT_REF_UUID

```
#define GATT_EXT_REPORT_REF_UUID 0x2907
```

4.4.2.19 GATT_INCLUDE_UUID

```
#define GATT_INCLUDE_UUID 0x2802
```

4.4.2.20 GATT_PRIMARY_SERVICE_UUID

```
#define GATT_PRIMARY_SERVICE_UUID 0x2800
```

4.4.2.21 GATT_REPORT_REF_UUID

```
#define GATT_REPORT_REF_UUID 0x2908
```

4.4.2.22 GATT_SECONDARY_SERVICE_UUID

```
#define GATT_SECONDARY_SERVICE_UUID 0x2801
```

4.4.2.23 GATT_SERV_CHAR_CFG_UUID

```
#define GATT_SERV_CHAR_CFG_UUID 0x2903
```

4.4.2.24 GATT_VALID_RANGE_UUID

```
#define GATT_VALID_RANGE_UUID 0x2906
```

4.4.2.25 INCLUDE_DECL_UUID128

```
#define INCLUDE_DECL_UUID128(

```

4.4.3 Enumeration Type Documentation

4.4.3.1 anonymous enum

anonymous enum

BLE GATT message id.

Enumerator

LE_GATT_MSG_INIT_CFM	initialize confirm message
LE_GATT_MSG_EXCHANGE_MTU_IND	exchange MTU indication
LE_GATT_MSG_EXCHANGE_MTU_CFM	exchange MTU confirm
LE_GATT_MSG_ACCESS_READ_IND	access read indication
LE_GATT_MSG_ACCESS_WRITE_IND	access write indication
LE_GATT_MSG_SERVICE_INFO_IND	service information indication
LE_GATT_MSG_FIND_ALL_PRIMARY_SERVICE↔ _CFM	find all primary service confirm
LE_GATT_MSG_FIND_PRIMARY_SERVICE_BY↔ _UUID_CFM	find primary service by UUID confirm
LE_GATT_MSG_INCLUDE_SERVICE_INFO_IND	include service information
LE_GATT_MSG_FIND_INCLUDED_SERVICE_CFM	find include service confirm
LE_GATT_MSG_CHARACTERISTIC_DECL_INF↔ O_IND	characteristic declaration info indication
LE_GATT_MSG_FIND_CHARACTERISTIC_CFM	find characteristic confirm
LE_GATT_MSG_CHAR_DESCRIPTOR_INFO_IND	characteristic descriptor info indication
LE_GATT_MSG_FIND_ALL_CHAR_DESC_CFM	find all characteristic descriptors confirm
LE_GATT_MSG_CHARACTERISTIC_VAL_IND	characteristic value, indication message
LE_GATT_MSG_READ_CHARACTERISTIC_VAL↔ UE_CFM	read characteristic value, confirm message
LE_GATT_MSG_READ_CHAR_VAL_BY_UUID_C↔ FM	read characteristic value by UUID confirm message
LE_GATT_MSG_READ_LONG_CHAR_VAL_CFM	read long characteristic value confirm message
LE_GATT_MSG_READ_MULTIPLE_CHAR_VAL ↔ CFM	read multiple characteristic value confirm
LE_GATT_MSG_WRITE_CHAR_VALUE_CFM	write characteristic value confirm
LE_GATT_MSG_WRITE_LONG_CHAR_VALUE ↔ CFM	write long characteristic value confirm
LE_GATT_MSG_WRITE_CHAR_VAL_RELIABLE↔ _CFM	write characteristic value reliable confirm
LE_GATT_MSG_PREPARE_WRITE_RELIABLE ↔ CFM	prepare write reliable confirm

Enumerator

LE_GATT_MSG_EXECUTE_WRITE_RELIABLE_CFM	execute write reliable confirm
LE_GATT_MSG_WRITE_NO_RSP_CFM	write no response confirm
LE_GATT_MSG_SIGNED_WRITE_CFM	signed write confirm
LE_GATT_MSG_NOTIFY_IND	notify indication
LE_GATT_MSG_NOTIFY_CFM	notify confirm
LE_GATT_MSG_INDICATE_IND	indicate indication
LE_GATT_MSG_CONFIRMATION_CFM	confirmation confirm
LE_GATT_MSG_OPERATION_TIMEOUT	operation timeout
LE_GATT_MSG_SIGN_RESOLUTION_FAIL	sign resolution fail
LE_GATT_MSG_TOP	top of GATT message id

4.4.4 Function Documentation

4.4.4.1 LeGattAccessReadRsp()

```
LE_ERR_STATE LeGattAccessReadRsp (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT8 att_err )
```

Gatt access read response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	attribute handle.
<i>att_err</i>	0 is OK, others refer to LE_ATT_ERR_* in ble_att_if.h .

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.2 LeGattAccessWriteRsp()

```
LE_ERR_STATE LeGattAccessWriteRsp (
    UINT16 conn_hdl,
    UINT8 method,
    UINT16 handle,
    UINT8 att_err )
```

Gatt access write response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>method</i>	refer to LE_GATT_FLAG_* in ble_gatt_if.h
<i>handle</i>	attribute handle.
<i>att_err</i>	0 is OK, others refer to LE_ATT_ERR_* in ble_att_if.h .

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.3 LeGattChangeAttrVal()

```
LE_ERR_STATE LeGattChangeAttrVal (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId,
    UINT16 len,
    void * val )
```

Change attribute value.

Parameters

	<i>svc</i>	service.
	<i>attrId</i>	attribute index of service.
in	<i>len</i>	attribute value length.
in	<i>val</i>	attribute value.

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.4 LeGattCharValConfirmation()

```
LE_ERR_STATE LeGattCharValConfirmation (
    UINT16 conn_hdl )
```

Prepare write characteristic value response.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.5 LeGattCharValIndicate()

```
LE_ERR_STATE LeGattCharValIndicate (
    UINT16 conn_hdl,
    UINT16 hdl,
    UINT16 len,
    UINT8 * pval )
```

Gatt characteristic value indication.

Parameters

<i>conn_hdl</i>	connection handle.
<i>hdl</i>	characteristic value handle.
<i>len</i>	value length.
<i>pval</i>	value.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.6 LeGattCharValNotify()

```
LE_ERR_STATE LeGattCharValNotify (
    UINT16 conn_hdl,
    UINT16 hdl,
    UINT16 len,
    UINT8 * pval )
```

Gatt characteristic value notification.

Parameters

<i>conn_hdl</i>	connection handle.
<i>hdl</i>	characteristic value handle.
<i>len</i>	value length.
<i>pval</i>	value.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.7 LeGattExchangeMtuReq()

```
LE_ERR_STATE LeGattExchangeMtuReq (
    UINT16 conn_hdl,
    UINT16 mtu )
```

Exchange MTU request.

Parameters

<i>conn_hdl</i>	connection handle.
<i>mtu</i>	MTU.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.8 LeGattExchangeMtuRsp()

```
LE_ERR_STATE LeGattExchangeMtuRsp (
    UINT16 conn_hdl,
    UINT16 mtu )
```

Exchange MTU response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>mtu</i>	MTU.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.9 LeGattExecuteWriteCharValReliable()

```
LE_ERR_STATE LeGattExecuteWriteCharValReliable (
    UINT16 conn_hdl,
    BOOL yesno )
```

Execute write characteristic value request.

Parameters

<i>conn_hdl</i>	connection handle.
<i>yesno</i>	execute write or not.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.10 LeGattFindAllCharacteristic()

```
LE_ERR_STATE LeGattFindAllCharacteristic (
    UINT16 conn_hdl,
    UINT16 start_hdl,
    UINT16 end_hdl )
```

Find all characteristic.

Parameters

<i>conn_hdl</i>	connection handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.11 LeGattFindAllCharDescriptor()

```
LE_ERR_STATE LeGattFindAllCharDescriptor (
    UINT16 conn_hdl,
    UINT16 start_hdl,
    UINT16 end_hdl )
```

Find all characteristic description.

Parameters

<i>conn_hdl</i>	connection handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.12 `LeGattFindAllPrimaryService()`

```
LE_ERR_STATE LeGattFindAllPrimaryService (
    UINT16 conn_hdl )
```

Find all primary service.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.13 `LeGattFindCharacteristicByUuid()`

```
LE_ERR_STATE LeGattFindCharacteristicByUuid (
    UINT16 conn_hdl,
    UINT16 start_hdl,
    UINT16 end_hdl,
    UINT8 format,
    UINT16 * uuid )
```

Find characteristic by UUID.

Parameters

<i>conn_hdl</i>	connection handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.
<i>format</i>	UUID type.
<i>uuid</i>	UUID.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.14 LeGattFindIncludedService()

```
LE_ERR_STATE LeGattFindIncludedService (
    UINT16 conn_hdl,
    UINT16 start_hdl,
    UINT16 end_hdl )
```

Find include service.

Parameters

<i>conn_hdl</i>	connection handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.15 LeGattFindPrimaryServiceByUuid()

```
LE_ERR_STATE LeGattFindPrimaryServiceByUuid (
    UINT16 conn_hdl,
    UINT8 format,
    UINT16 * uuid )
```

Find primary service by UUID.

Parameters

<i>conn_hdl</i>	connection handle.
<i>format</i>	UUID type.
<i>uuid</i>	UUID.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.16 LeGattGetAttrHandle()

```

UINT16 LeGattGetAttrHandle (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId )

```

Get attribute handle.

Parameters

<i>svc</i>	service.
<i>attrId</i>	attribute index of service.

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.17 LeGattGetAttrVal()

```

LE_ERR_STATE LeGattGetAttrVal (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId,
    UINT16 * len,
    void * val )

```

Get attribute value.

Parameters

	<i>svc</i>	service.
	<i>attrId</i>	attribute index of service.
out	<i>len</i>	attribute value length.
out	<i>val</i>	attribute value.

Returns

- SYS_ERR_SUCCESS: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.18 LeGattGetAttrValLen()

```

UINT16 LeGattGetAttrValLen (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId )

```

Get the length of attribute value.

Parameters

<i>svc</i>	service.
<i>attr↔ Id</i>	attribute index of service.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.19 `LeGattGetAttrValMaxLen()`

```
UINT16 LeGattGetAttrValMaxLen (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId )
```

Get the max length of attribute value.

Parameters

<i>svc</i>	service.
<i>attr↔ Id</i>	attribute index of service.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.20 `LeGattInit()`

```
void LeGattInit (
    TASK appTask )
```

BLE Gatt module init.

Parameters

<i>appTask</i>	the reference of BLE task.
----------------	----------------------------

Returns

None.

4.4.4.21 LeGattModifyAttrVal()

```
LE_ERR_STATE LeGattModifyAttrVal (
    LE_GATT_SERVICE_T * svc,
    UINT16 attrId,
    UINT16 offset,
    UINT16 len,
    void * val )
```

Modify attribute value.

Parameters

<i>svc</i>	servie.
<i>attrId</i>	attribute index of service.
<i>offset</i>	modify offset.
<i>len</i>	modify length.
<i>val</i>	modify value.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.22 LeGattPrepareWriteCharValReliable()

```
LE_ERR_STATE LeGattPrepareWriteCharValReliable (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 offset,
    UINT16 len,
    UINT8 * val )
```

Prepare write characteristic value request.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>offset</i>	offset written.
<i>len</i>	length written.
<i>val</i>	value.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.23 LeGattReadCharValByUuid()

```
LE_ERR_STATE LeGattReadCharValByUuid (
    UINT16 conn_hdl,
    UINT16 start_hdl,
    UINT16 end_hdl,
    UINT8 format,
    UINT16 * uuid )
```

Read a characteristic value by UUID.

Parameters

<i>conn_hdl</i>	connection handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.
<i>format</i>	UUID type.
<i>uuid</i>	UUID.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.24 LeGattReadCharValue()

```
LE_ERR_STATE LeGattReadCharValue (
    UINT16 conn_hdl,
    UINT16 handle )
```

Read a characteristic value.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.25 LeGattReadLongCharVal()

```
LE_ERR_STATE LeGattReadLongCharVal (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 offset )
```

Read a long characteristic value.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>offset</i>	characteristic value offset.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.26 LeGattReadMultipleCharVal()

```
LE_ERR_STATE LeGattReadMultipleCharVal (
    UINT16 conn_hdl,
    UINT16 count,
    UINT16 * handle )
```

Read Multiple characteristic values.

Parameters

<i>conn_hdl</i>	connection handle.
<i>count</i>	handle count.
<i>handle</i>	handle table.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.27 LeGattRegisterIncludeService()

```
LE_ERR_STATE LeGattRegisterIncludeService (
    UINT16 inc_hdl,
```

```

UINT16 start_hdl,
UINT16 end_hdl,
UINT16 uuid )

```

Called to register an include service.

Parameters

<i>inc_hdl</i>	include service handle.
<i>start_hdl</i>	start handle.
<i>end_hdl</i>	end handle.
<i>uuid</i>	include service UUID.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.28 LeGattRegisterService()

```

LE_GATT_SERVICE_T* LeGattRegisterService (
    LE_GATT_ATTR_T * attrTable,
    UINT16 numAttr )

```

Called to register a service.

Parameters

<i>attrTable</i>	service attribute table.
<i>numAttr</i>	the attribute number of service.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.29 LeGattSignedWriteNoRsp()

```

LE_ERR_STATE LeGattSignedWriteNoRsp (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 len,
    UINT8 * val )

```

Signed write without response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>len</i>	length of the data to be written.
<i>val</i>	the value to be written.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.30 LeGattStopCurrentProcedure()

```
void LeGattStopCurrentProcedure (
    UINT16 conn_hdl )
```

Stop current procedure.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.31 LeGattWriteCharVal()

```
LE_ERR_STATE LeGattWriteCharVal (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 len,
    UINT8 * val )
```

Write characteristic value.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>len</i>	length of the data to be written.
<i>val</i>	the value to be written.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.32 `LeGattWriteCharValReliable()`

```
LE_ERR_STATE LeGattWriteCharValReliable (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 offset,
    UINT16 len,
    UINT8 * val )
```

Write characteristic value reliable.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>offset</i>	offset written.
<i>len</i>	length written.
<i>val</i>	value.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.33 `LeGattWriteLongCharVal()`

```
LE_ERR_STATE LeGattWriteLongCharVal (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 offset,
    UINT16 len,
    UINT8 * val )
```

Write long characteristic value.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>offset</i>	value position offset.
<i>len</i>	length of the data to be written.
<i>val</i>	the value to be written.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

4.4.4.34 LeGattWriteNoRsp()

```
LE_ERR_STATE LeGattWriteNoRsp (
    UINT16 conn_hdl,
    UINT16 handle,
    UINT16 len,
    UINT8 * val )
```

Write without response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>handle</i>	characteristic value handle.
<i>len</i>	length of the data to be written.
<i>val</i>	the value to be written.

Returns

- `SYS_ERR_SUCCESS`: success.
- others: refer to error code in [ble_err.h](#).

Enumerations

- `enum { LE_SYS_MSG_BUF_OVERFLOW = (LE_SYS_MSG_BASE + 1), LE_SYS_MSG_TOP }`
BLE system message id.

Functions

- UINT16 [LeCancelAllMessage](#) (TASK task, MESSAGEID id)
Cancel all message in queue.
- UINT16 [LeCancelAllSubMessage](#) (TASK task, MESSAGEID id, MSGSUBID subId)
Cancel all sub message in queue.
- BOOL [LeCancelFirstMessage](#) (TASK task, MESSAGEID id)
Cancel the first message in queue.
- BOOL [LeCancelFirstSubMessage](#) (TASK task, MESSAGEID id, MSGSUBID subId)
Cancel the first sub message in queue.
- UINT16 [LeGetSubMsgId](#) (UINT16 *s)
Get sub message id.
- BOOL [LeHostCreateTask](#) (TASK task, TASKHANDLER hdl)
Create BLE task.
- void [LeHostMessageLoop](#) (void)
message loop run.
- void [LeSendMessage](#) (TASK task, MESSAGEID msgId, MESSAGE msg)
Send message to BLE task.
- void [LeSendMessageAfter](#) (TASK task, MESSAGEID msgId, MESSAGE msg, UINT32 delay)
Delay, then send message to BLE task.
- void [LeSendMessageUnlock](#) (TASK task, MESSAGEID id, MESSAGE msg, MSGLOCK lock)
Send message until lock is 0.
- void [LeSendSubMessage](#) (TASK task, MESSAGEID msgId, MSGSUBID subId, MESSAGE msg)
Send sub message.
- void [LeSendSubMessageAfter](#) (TASK task, MESSAGEID msgId, MSGSUBID subId, MESSAGE msg, UINT32 delay)
Delay, then send sub message.
- void [LeSendSubMessageUnlock](#) (TASK task, MESSAGEID id, MSGSUBID subId, MESSAGE msg, MSGLOCK lock)
Send sub message until lock is 0.

4.5.4 Enumeration Type Documentation

4.5.4.1 anonymous enum

anonymous enum

BLE system message id.

Enumerator

LE_SYS_MSG_BUF_OVERFLOW	message buffer overflow
LE_SYS_MSG_TOP	top of system message id

4.5.5 Function Documentation

4.5.5.1 LeCancelAllMessage()

```
UINT16 LeCancelAllMessage (
    TASK task,
    MESSAGEID id )
```

Cancel all message in queue.

Parameters

<i>task</i>	task.
<i>id</i>	message id.

Returns

0 is ok, others is error.

4.5.5.2 LeCancelAllSubMessage()

```
UINT16 LeCancelAllSubMessage (
    TASK task,
    MESSAGEID id,
    MSGSUBID subId )
```

Cancel all sub message in queue.

Parameters

<i>task</i>	the task of recvice message.
<i>id</i>	message id.
<i>sub↔ id</i>	sub message id.

Returns

0 is ok, others is error.

4.5.5.3 LeCancelFirstMessage()

```
BOOL LeCancelFirstMessage (
    TASK task,
    MESSAGEID id )
```

Cancel the first message in queue.

Parameters

<i>task</i>	task.
<i>id</i>	message id.

Returns

True is ok, false is error.

4.5.5.4 LeCancelFirstSubMessage()

```
BOOL LeCancelFirstSubMessage (
    TASK task,
    MESSAGEID id,
    MSGSUBID subId )
```

Cancel the first sub message in queue.

Parameters

<i>task</i>	the task of recvice message.
<i>id</i>	message id.
<i>subId</i>	sub message id.

Returns

True is ok, false is error.

4.5.5.5 LeGetSubMsgId()

```
UINT16 LeGetSubMsgId (
    UINT16 * s )
```

Get sub message id.

Parameters

<i>sub</i>	message id.
------------	-------------

Returns

0 is ok, others is error.

4.5.5.6 LeHostCreateTask()

```
BOOL LeHostCreateTask (
    TASK task,
    TASKHANDLER hdl )
```

Create BLE task.

Parameters

<i>task</i>	the reference of BLE task.
<i>hdl</i>	callback handle of BLE task.

Returns

TRUE is success, FALSE is failed.

4.5.5.7 LeHostMessageLoop()

```
void LeHostMessageLoop (  
    void )
```

message loop run.

Returns

None.

4.5.5.8 LeSendMessage()

```
void LeSendMessage (  
    TASK task,  
    MESSAGEID msgId,  
    MESSAGE msg )
```

Send message to BLE task.

Parameters

<i>task</i>	reference of BLE task.
<i>msgId</i>	message ID.
<i>msg</i>	message.

Returns

None.

4.5.5.9 LeSendMessageAfter()

```
void LeSendMessageAfter (  
    TASK task,
```

```

MESSAGEID msgId,
MESSAGE msg,
UINT32 delay )

```

Delay, then send message to BLE task.

Parameters

<i>task</i>	reference of BLE task.
<i>msg</i> ↔ <i>Id</i>	message ID.
<i>msg</i>	message.
<i>delay</i>	delay time, ms.

Returns

None.

4.5.5.10 LeSendMessageUnlock()

```

void LeSendMessageUnlock (
    TASK task,
    MESSAGEID id,
    MESSAGE msg,
    MSGLOCK lock )

```

Send message until lock is 0.

Parameters

<i>task</i>	the task of recvice message.
<i>id</i>	message id.
<i>msg</i>	message.
<i>lock</i>	lock number.

Returns

None.

4.5.5.11 LeSendSubMessage()

```

void LeSendSubMessage (
    TASK task,
    MESSAGEID msgId,
    MSGSUBID subId,
    MESSAGE msg )

```

Send sub message.

Parameters

<i>task</i>	the task of recvice message.
<i>msg↔ Id</i>	message id.
<i>subId</i>	sub message id.
<i>msg</i>	message.

Returns

None.

4.5.5.12 LeSendSubMessageAfter()

```
void LeSendSubMessageAfter (
    TASK task,
    MESSAGEID msgId,
    MSGSUBID subId,
    MESSAGE msg,
    UINT32 delay )
```

Delay, then send sub message.

Parameters

<i>task</i>	the task of recvice message.
<i>msg↔ Id</i>	message id.
<i>subId</i>	sub message id.
<i>msg</i>	message.
<i>delay</i>	delay time.

Returns

None.

4.5.5.13 LeSendSubMessageUnlock()

```
void LeSendSubMessageUnlock (
    TASK task,
    MESSAGEID id,
    MSGSUBID subId,
    MESSAGE msg,
    MSGLOCK lock )
```

Send sub message until lock is 0.

Parameters

<i>task</i>	the task of recvice message.
<i>id</i>	message id.
<i>sub↔ id</i>	sub message id.
<i>msg</i>	message.
<i>lock</i>	lock number.

Returns

None.

4.6.3.2 anonymous enum

```
anonymous enum
```

Enumerator

LE_SMP_PAIR_JUST_WORK	just work
LE_SMP_PAIR_OOB	out of band
LE_SMP_PAIR_PASSKEY_INPUT	passkey entry
LE_SMP_PAIR_DISPLAY	display
LE_SMP_PAIR_NUM_COMPARE	number compare

4.6.4 Function Documentation

4.6.4.1 LeSmpInit()

```
void LeSmpInit (
    TASK appTask )
```

BLE SMP Module Init.

Parameters

<i>appTask</i>	the reference of BLE task.
----------------	----------------------------

Returns

None.

4.6.4.2 LeSmpOobAuthDataRsp()

```
void LeSmpOobAuthDataRsp (
    UINT16 conn_hdl,
    UINT8 * data,
    UINT16 len )
```

SMP OOB authenticate data response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>data</i>	response data.
<i>len</i>	data length.

Returns

None.

4.6.4.3 LeSmpOobPresent()

```
UINT16 LeSmpOobPresent (
    UINT16 conn_hdl,
    BOOL oob_present )
```

SMP OOB present.

Parameters

<i>conn_hdl</i>	connection handle.
<i>oob_present</i>	present or not.

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.6.4.4 LeSmpPasskeyInput()

```
void LeSmpPasskeyInput (
    UINT16 conn_hdl,
    UINT32 passkey )
```

Input passkey.

Parameters

<i>conn_hdl</i>	connection handle.
<i>passkey</i>	passkey.

Returns

None.

4.6.4.5 LeSmpScOobComputeConfirmVal()

```
UINT16 LeSmpScOobComputeConfirmVal (
    UINT8 * rand,
    UINT8 * confirm )
```

SMP secure connection OOB compute confirm value.

Parameters

<i>rand</i>	random data.
<i>confirm</i>	confirm data.

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.6.4.6 LeSmpScOobDataRsp()

```
void LeSmpScOobDataRsp (
    UINT16 conn_hdl,
    UINT8 * our_rand,
    LE_SMP_SC_OOB_DATA_T * peer )
```

OOB data response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>our_rand</i>	our random data.
<i>peer</i>	peer OOB data.

Returns

None.

4.6.4.7 LeSmpSecurityReq()

```
UINT16 LeSmpSecurityReq (
    UINT16 conn_hdl )
```

BLE SMP security request.

Parameters

<i>conn_hdl</i>	connection handle.
-----------------	--------------------

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.6.4.8 LeSmpSecurityRsp()

```
UINT16 LeSmpSecurityRsp (
    UINT16 conn_hdl,
    BOOL accept )
```

BLE SMP security request.

Parameters

<i>conn_hdl</i>	connection handle.
<i>accept</i>	TRUE is accept, FALSE is not.

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.6.4.9 LeSmpSetDefaultConfig()

```
UINT16 LeSmpSetDefaultConfig (
    UINT8 iocap,
    BOOL mitm,
    BOOL sc,
    BOOL bond )
```

Set default configure for pairing.

Parameters

<i>iocap</i>	IO capability.
<i>mitm</i>	TRUE is MITM protected, FALSE is not.
<i>sc</i>	TRUE is request BLE secure connection pairing, FALSE is not.
<i>bond</i>	TRUE: bonding, FALSE: no bonding.

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.6.4.10 LeSmpUserConfirmRsp()

```
UINT16 LeSmpUserConfirmRsp (
    UINT16 conn_hdl,
    BOOL accept )
```

User confirm response.

Parameters

<i>conn_hdl</i>	connection handle.
<i>accept</i>	yes or no.

Returns

0 is Ok, others refer to SMP_ERR_* in [ble_err.h](#).

4.7 WIFI APIS

WIFI APIS.

Modules

- [WIFI Common APIs](#)
- [WIFI STA APIs](#)
- [Enumeration](#)

Data Structures

- struct [wifi_active_scan_time_t](#)
Range of active scan times per channel.
- struct [wifi_ap_config_t](#)
This structure is the Wi-Fi configuration for initialization for Soft-AP mode.
- struct [wifi_auto_connect_info_t](#)
This structure is the Wi-Fi auto connect for save in the flash (FIM).
- union [wifi_config_t](#)
Wi-Fi configuration for initialization.
- struct [wifi_fast_scan_threshold_t](#)
Structure describing parameters for a Wi-Fi fast scan.
- struct [wifi_init_config_t](#)
WiFi stack configuration parameters.
- struct [wifi_scan_config_t](#)
Parameters for an SSID scan.
- struct [wifi_scan_info_t](#)
This structure defines the inforamtion of scanned APs.
- struct [wifi_scan_list_t](#)
This structure defines the list of scanned APs with their corresponding information.
- union [wifi_scan_time_t](#)
Aggregate of active & passive scan time per channel.
- struct [wifi_sta_config_t](#)
This structure is the Wi-Fi configuration for initialization for STA mode.
- struct [wifi_wpa_ie_data_t](#)
This structure is the Wi-Fi auto connect with wpa information for save in the flash (FIM).

Macros

- #define [WIFI_BEACON_INTERVAL_LENGTH](#) (2)
Beacon interval length in a frame header.
- #define [WIFI_CAPABILITY_INFO_LENGTH](#) (2)
Length of capability information in a frame header.
- #define [WIFI_LENGTH_802_11](#) (24)
Length of 802.11 MAC header.
- #define [WIFI_LENGTH_PASSPHRASE](#) (64)
The maximum length of passphrase used in WPA-PSK and WPA2-PSK encryption types.
- #define [WIFI_MAC_ADDRESS_LENGTH](#) (6)

- *MAC address length.*
- `#define WIFI_MAC_NUM_OF_CHANNELS (14)`
maximum number of WIFI channels
- `#define WIFI_MAX_LENGTH_OF_SSID (32+1)`
The maximum length of SSID.
- `#define WIFI_MAX_SCAN_AP_NUM (16)`
maximum number of ap list items which can stored
- `#define WIFI_MAX_SUPPORTED_RATES (8)`
maximum number of supported data rate

Typedefs

- `typedef wifi_scan_info_t wifi_ap_record_t`
- `typedef int(* wifi_event_notify_cb_t) (void *data)`

Enumerations

- `enum wifi_auto_connet_mode_e { WIFI_AUTO_CONNECT_DISABLE, WIFI_AUTO_CONNECT_ENABLE }`
WiFi auto connect mode parameters.

Functions

- `int wifi_event_process_handler (wifi_event_t event, uint8_t *payload, uint32_t length)`
Default event handler for system events.
- `void wifi_install_default_event_handlers (void)`
install default event handler for wifi event (internal use)
- `int wifi_register_event_handler (wifi_event_t idx, wifi_event_handler_t handler)`
register wifi event handler (internal use)

4.7.1 Detailed Description

WIFI APIs.

4.7.2 Macro Definition Documentation

4.7.2.1 WIFI_BEACON_INTERVAL_LENGTH

```
#define WIFI_BEACON_INTERVAL_LENGTH (2)
```

Beacon interval length in a frame header.

4.7.2.2 WIFI_CAPABILITY_INFO_LENGTH

```
#define WIFI_CAPABILITY_INFO_LENGTH (2)
```

Length of capability information in a frame header.

4.7.2.3 WIFI_LENGTH_802_11

```
#define WIFI_LENGTH_802_11 (24)
```

Length of 802.11 MAC header.

4.7.2.4 WIFI_LENGTH_PASSPHRASE

```
#define WIFI_LENGTH_PASSPHRASE (64)
```

The maximum length of passphrase used in WPA-PSK and WPA2-PSK encryption types.

4.7.2.5 WIFI_MAC_ADDRESS_LENGTH

```
#define WIFI_MAC_ADDRESS_LENGTH (6)
```

MAC address length.

4.7.2.6 WIFI_MAC_NUM_OF_CHANNELS

```
#define WIFI_MAC_NUM_OF_CHANNELS (14)
```

maximum number of WIFI channels

4.7.2.7 WIFI_MAX_LENGTH_OF_SSID

```
#define WIFI_MAX_LENGTH_OF_SSID (32+1)
```

The maximum length of SSID.

4.7.2.8 WIFI_MAX_SCAN_AP_NUM

```
#define WIFI_MAX_SCAN_AP_NUM (16)
```

maximum number of ap list items which can stored

4.7.2.9 WIFI_MAX_SUPPORTED_RATES

```
#define WIFI_MAX_SUPPORTED_RATES (8)
```

maximum number of supported data rate

4.7.3 Typedef Documentation

4.7.3.1 wifi_ap_record_t

```
typedef wifi_scan_info_t wifi_ap_record_t
```

4.7.3.2 wifi_event_notify_cb_t

```
typedef int(* wifi_event_notify_cb_t) (void *data)
```

4.7.4 Enumeration Type Documentation

4.7.4.1 wifi_auto_connet_mode_e

```
enum wifi_auto_connet_mode_e
```

WiFi auto connect mode parameters.

Enumerator

WIFI_AUTO_CONNECT_DISABLE	
WIFI_AUTO_CONNECT_ENABLE	

4.7.5 Function Documentation

4.7.5.1 wifi_event_process_handler()

```
int wifi_event_process_handler (
    wifi_event_t event,
    uint8_t * payload,
    uint32_t length )
```

Default event handler for system events.

This function performs default handling of system events. When using event_loop APIs, it is called automatically before invoking the user-provided callback function.

Applications which implement a custom event loop must call this function as part of event processing.

Parameters

in	<i>event</i>	event type Set the event type,Options are <ul style="list-style-type: none">• WIFI_EVENT_INIT_COMPLETE• WIFI_EVENT_SCAN_COMPLETE• WIFI_EVENT_STA_START• WIFI_EVENT_STA_STOP• WIFI_EVENT_STA_CONNECTED• WIFI_EVENT_STA_DISCONNECTED• WIFI_EVENT_STA_CONNECTION_FAILED• WIFI_EVENT_STA_GOT_IP
in	<i>payload</i>	Data block that transmitted to event
in	<i>length</i>	The length of data block

Returns

0 : success
other : failed

4.7.5.2 wifi_install_default_event_handlers()

```
void wifi_install_default_event_handlers (
    void )
```

install default event handler for wifi event (internal use)

4.7.5.3 wifi_register_event_handler()

```
int wifi_register_event_handler (
    wifi_event_t idx,
    wifi_event_handler_t handler )
```

register wifi event handler (internal use)

Parameters

in	<i>idx</i>	one of the enums of bt_scan_mode_t
in	<i>handler</i>	the Wi-Fi event handler

Returns

0 : success
other : failed

4.8 WIFI Common APIs

Data Structures

- struct [event_msg_t](#)
Send information to event by [event_msg_t](#).
- union [wifi_event_info_t](#)
[wifi_event_info_t](#)
- struct [wifi_event_sta_connected_t](#)
[wifi_event_sta_connected_t](#)
- struct [wifi_event_sta_disconnected_t](#)
[wifi_event_sta_disconnected_t](#)
- struct [wifi_event_sta_got_ip_t](#)
- struct [wifi_event_sta_scan_done_t](#)
[wifi_event_sta_scan_done_t](#)

Typedefs

- typedef int(* [wifi_event_cb_t](#)) ([wifi_event_id_t](#) event, void *data, uint16_t length)
Application specified event callback function.

Functions

- int [wifi_event_loop_init](#) ([wifi_event_cb_t](#) cb)
Event Loop Initialization Create the event handler and call back funtion.
- int [wifi_event_loop_send](#) ([event_msg_t](#) *msg)
Send an event to event task.
- void [wifi_event_loop_set_cb](#) ([wifi_event_cb_t](#) cb, void *ctx)
Set application specified event callback function.
- int [wifi_event_process_handler](#) ([wifi_event_t](#) event, uint8_t *payload, uint32_t length)
Default event handler for system events.

4.8.1 Detailed Description

4.8.2 Typedef Documentation

4.8.2.1 [wifi_event_cb_t](#)

```
typedef int(* wifi\_event\_cb\_t) (wifi\_event\_id\_t event, void *data, uint16_t length)
```

Application specified event callback function.

4.8.3 Function Documentation

4.8.3.1 [wifi_event_loop_init\(\)](#)

```
int wifi\_event\_loop\_init (  
    wifi\_event\_cb\_t cb )
```

Event Loop Initialization Create the event handler and call back funtion.

Parameters

<code>cb</code>	: application specified event callback
-----------------	--

Returns

0 : success
other : failed

4.8.3.2 wifi_event_loop_send()

```
int wifi_event_loop_send (
    event_msg_t * msg )
```

Send an event to event task.

Attention

1. Other task/modules, such as the TCP/IP module, can call this API to send an event to event task

Parameters

<code>event_msg_t</code>	* msg: Send information to event by msg
--------------------------	---

Returns

0 : success
other : failed

4.8.3.3 wifi_event_loop_set_cb()

```
void wifi_event_loop_set_cb (
    wifi_event_cb_t cb,
    void * ctx )
```

Set application specified event callback function.

Attention

1. If cb is NULL, means application does not need to handle. If cb is not NULL, it will be called when an event is received and after the default event callback is completed

Parameters

<i>wifi_event_cb_t</i>	cb : callback
<i>void</i>	*ctx : reserved for user

4.8.3.4 `wifi_event_process_handler()`

```
int wifi_event_process_handler (
    wifi_event_t event,
    uint8_t * payload,
    uint32_t length )
```

Default event handler for system events.

This function performs default handling of system events.

Applications which implement a custom event loop must call this function as part of event processing.

Parameters

in	<i>event</i>	event type Set the event type,Options are <ul style="list-style-type: none"> • WIFI_EVENT_INIT_COMPLETE • WIFI_EVENT_SCAN_COMPLETE • WIFI_EVENT_STA_START • WIFI_EVENT_STA_STOP • WIFI_EVENT_STA_CONNECTED • WIFI_EVENT_STA_DISCONNECTED • WIFI_EVENT_STA_CONNECTION_FAILED • WIFI_EVENT_STA_GOT_IP
in	<i>payload</i>	Data block transmitted to event
in	<i>length</i>	The length of the data block

Returns

0 : success
other : failed

4.9 WIFI STA APIs

Macros

- `#define WIFI_READY_TIME 2000`

Typedefs

- `typedef int(* wifi_auto_connect_clear_ap_info_fp_t) (uint8_t index)`
- `typedef int(* wifi_auto_connect_get_ap_info_fp_t) (uint8_t index, wifi_auto_connect_info_t *info)`
- `typedef int(* wifi_auto_connect_get_ap_num_fp_t) (uint8_t *num)`
- `typedef int(* wifi_auto_connect_get_mode_fp_t) (uint8_t *mode)`
- `typedef int(* wifi_auto_connect_init_fp_t) (void)`
- `typedef int(* wifi_auto_connect_reset_fp_t) (void)`
- `typedef int(* wifi_auto_connect_set_ap_num_fp_t) (uint8_t num)`
- `typedef int(* wifi_auto_connect_set_mode_fp_t) (uint8_t mode)`
- `typedef int(* wifi_auto_connect_start_fp_t) (void)`
- `typedef int(* wifi_config_get_bandwidth_fp_t) (wifi_mode_t interface, wifi_bandwidth_t *bandwidth)`
- `typedef int(* wifi_config_get_bssid_fp_t) (uint8_t *bssid)`
- `typedef int(* wifi_config_get_channel_fp_t) (wifi_mode_t interface, uint8_t *channel)`
- `typedef int(* wifi_config_get_dtim_interval_fp_t) (uint8_t *interval)`
- `typedef int(* wifi_config_get_listen_interval_fp_t) (uint8_t *interval)`
- `typedef int(* wifi_config_get_mac_address_fp_t) (wifi_mode_t interface, uint8_t *address)`
- `typedef int(* wifi_config_get_opmode_fp_t) (uint8_t *mode)`
- `typedef int(* wifi_config_get_ssid_fp_t) (uint8_t *ssid, uint8_t *ssid_length)`
- `typedef int(* wifi_config_set_bandwidth_fp_t) (wifi_mode_t interface, wifi_bandwidth_t bandwidth)`
- `typedef int(* wifi_config_set_bssid_fp_t) (uint8_t *bssid)`
- `typedef int(* wifi_config_set_channel_fp_t) (wifi_mode_t interface, uint8_t channel)`
- `typedef int(* wifi_config_set_dtim_interval_fp_t) (uint8_t interval)`
- `typedef int(* wifi_config_set_listen_interval_fp_t) (uint8_t interval)`
- `typedef int(* wifi_config_set_mac_address_fp_t) (wifi_mode_t interface, uint8_t *address)`
- `typedef int(* wifi_config_set_opmode_fp_t) (uint8_t mode)`
- `typedef int(* wifi_config_set_ssid_fp_t) (wifi_mode_t interface, uint8_t *ssid, uint8_t ssid_length)`
- `typedef int(* wifi_connection_connect_fp_t) (wifi_config_t *config)`
- `typedef int(* wifi_connection_disconnect_ap_fp_t) (void)`
- `typedef int(* wifi_connection_disconnect_sta_fp_t) (uint8_t *address)`
- `typedef int(* wifi_connection_get_rssi_fp_t) (int8_t *rssi)`
- `typedef int(* wifi_connection_register_event_handler_fp_t) (wifi_event_t event, wifi_event_handler_t handler)`
- `typedef int(* wifi_connection_scan_start_fp_t) (uint8_t *ssid, uint8_t ssid_length, uint8_t *bssid, uint8_t scan_mode, uint8_t scan_option)`
- `typedef int(* wifi_connection_unregister_event_handler_fp_t) (wifi_event_t event, wifi_event_handler_t handler)`
- `typedef int(* wifi_convert_auth_mode_fp_t) (int wpa_pro, int privacy)`
- `typedef int(* wifi_deinit_fp_t) (void)`
- `typedef int32_t(* wifi_event_handler_t) (wifi_event_t event, uint8_t *payload, uint32_t length)`
This defines the Wi-Fi event handler. Call `wifi_connection_register_event_handler()` to register a handler, then the Wi-Fi driver generates an event and sends it to the handler.
- `typedef int(* wifi_fast_connect_get_mode_fp_t) (uint8_t ap_index, uint8_t *mode)`
- `typedef int(* wifi_fast_connect_set_mode_fp_t) (uint8_t ap_index, uint8_t mode)`
- `typedef int(* wifi_fast_connect_start_fp_t) (uint8_t ap_index)`
- `typedef int(* wifi_get_config_fp_t) (wifi_mode_t interface, wifi_config_t *conf)`
- `typedef void(* wifi_init_complete_cb_t) (void *ctx)`
Initialization of complete callback function.

- typedef int(* [wifi_init_fp_t](#)) (const [wifi_init_config_t](#) *config, [wifi_init_complete_cb_t](#) init_cb)
- typedef int32_t [wifi_result_t](#)
- typedef int(* [wifi_scan_get_ap_list_fp_t](#)) ([wifi_scan_list_t](#) *scan_list)
- typedef int(* [wifi_scan_get_ap_num_fp_t](#)) (uint16_t *number)
- typedef int(* [wifi_scan_get_ap_records_fp_t](#)) (uint16_t *number, [wifi_scan_info_t](#) *ap_records)
- typedef int(* [wifi_scan_start_fp_t](#)) (const [wifi_scan_config_t](#) *config, bool block)
- typedef int(* [wifi_scan_stop_fp_t](#)) (void)
- typedef int(* [wifi_set_config_fp_t](#)) ([wifi_mode_t](#) interface, [wifi_config_t](#) *conf)
- typedef int(* [wifi_sta_get_ap_info_fp_t](#)) ([wifi_ap_record_t](#) *ap_info)
- typedef int(* [wifi_start_fp_t](#)) (void)
- typedef int(* [wifi_stop_fp_t](#)) (void)

Functions

- int [wifi_auto_connect_clear_ap_info](#) (uint8_t index)
Clear the AP information which index in the.
- int [wifi_auto_connect_get_ap_info](#) (uint8_t index, [wifi_auto_connect_info_t](#) *info)
Get the AP information.
- int [wifi_auto_connect_get_ap_num](#) (uint8_t *num)
Get the maximum number of AP information.
- int [wifi_auto_connect_get_mode](#) (uint8_t *mode)
Get the auto connect mode.
- int [wifi_auto_connect_get_saved_ap_num](#) (uint8_t *num)
Get the current number of AP save in flash.
- int [wifi_auto_connect_init](#) (void)
Initialize function of auto connect.
- int [wifi_auto_connect_reset](#) (void)
Reset all of auto/fast connect configuration.
- int [wifi_auto_connect_set_ap_num](#) (uint8_t num)
Set the maximum number of AP information.
- int [wifi_auto_connect_set_mode](#) (uint8_t mode)
Set the auto connect mode.
- int [wifi_auto_connect_start](#) (void)
Start auto connect mechanism.
- int [wifi_auto_connect_update_ch](#) (uint8_t ac_index, uint8_t channel)
Update the channel which AP index in auto connect list.
- int [wifi_config_get_bandwidth](#) ([wifi_mode_t](#) interface, [wifi_bandwidth_t](#) *bandwidth)
Get the bandwidth of OPL1000 specified interface.
- int [wifi_config_get_bssid](#) (uint8_t *bssid)
get bssid after scan
- int [wifi_config_get_channel](#) ([wifi_mode_t](#) interface, uint8_t *channel)
Get the primary/secondary channel of OPL1000.
- int [wifi_config_get_dtim_interval](#) (uint8_t *interval)
- int [wifi_config_get_listen_interval](#) (uint8_t *interval)
- int [wifi_config_get_mac_address](#) ([wifi_mode_t](#) interface, uint8_t *address)
Get mac of specified interface.
- int [wifi_config_get_mac_tx_data_rate](#) ([wifi_mac_data_rate_t](#) *data_rate)
Get the Mac tx data rate in current wifi setting of OPL1000.
- int [wifi_config_get_opmode](#) (uint8_t *mode)
- int [wifi_config_get_skip_dtim](#) (uint8_t *value)
Get the Skip DTIM value in current wifi setting of OPL1000.

- int [wifi_config_get_ssid](#) (uint8_t *ssid, uint8_t *ssid_length)
Get ssid value of AP.
- int [wifi_config_get_sta_mac_address_from_flash](#) (uint8_t *bssid)
Get mac address of station from flash.
- int [wifi_config_set_bandwidth](#) (wifi_mode_t interface, wifi_bandwidth_t bandwidth)
Set the bandwidth of OPL1000 specified interface.
- int [wifi_config_set_bssid](#) (uint8_t *bssid)
config OPL1000 Wi-Fi bssid.
- int [wifi_config_set_channel](#) (wifi_mode_t interface, uint8_t channel)
Set primary/secondary channel of OPL1000.
- int [wifi_config_set_dtim_interval](#) (uint8_t interval)
- int [wifi_config_set_listen_interval](#) (uint8_t interval)
- int [wifi_config_set_mac_address](#) (wifi_mode_t interface, uint8_t *address)
Set MAC address of OPL1000 Wi-Fi station or the soft-AP interface.
- int [wifi_config_set_mac_tx_data_rate](#) (wifi_mac_data_rate_t data_rate)
Set the Mac tx data rate setting of OPL1000.
- int [wifi_config_set_opmode](#) (uint8_t mode)
- int [wifi_config_set_skip_dtim](#) (uint8_t value, bool save_flash)
Set the Skip DTIM value of OPL1000.
- int [wifi_config_set_ssid](#) (wifi_mode_t interface, uint8_t *ssid, uint8_t ssid_length)
Set the ssid value of the current device.
- int [wifi_connection_connect](#) (wifi_config_t *config)
Connect OPL1000 Wi-Fi station to certain AP.
- int [wifi_connection_connect_from_ac_index](#) (uint8_t index)
Connect OPL1000 Wi-Fi station to certain AP by auto connect index.
- int [wifi_connection_connect_from_ac_list](#) (wifi_config_t *config)
Connect OPL1000 Wi-Fi station to certain AP in auto connect list.
- int [wifi_connection_disconnect_ap](#) (void)
Disconnect the link between OPL1000 and connected AP.
- int [wifi_connection_disconnect_sta](#) (uint8_t *address)
Disconnect the link between the current device and the station.
- int [wifi_connection_get_rssi](#) (int8_t *rssi)
get signal strength of AP
- int [wifi_connection_register_event_handler](#) (wifi_event_t event, wifi_event_handler_t handler)
register wifi call back handler
- int [wifi_connection_scan_start](#) (uint8_t *ssid, uint8_t ssid_length, uint8_t *bssid, uint8_t scan_mode, uint8_t scan_option)
- int [wifi_connection_unregister_event_handler](#) (wifi_event_t event, wifi_event_handler_t handler)
unregister wifi call back handler
- int [wifi_convert_auth_mode](#) (int wpa_pro, int privacy)
- int [wifi_deinit](#) (void)
De-init Wi-Fi Initialization and Configuration functions.
- int [wifi_fast_connect_get_mode](#) (uint8_t ap_index, uint8_t *mode)
Get the fast connect mode.
- int [wifi_fast_connect_set_mode](#) (uint8_t ap_index, uint8_t mode)
Set the fast connect mode.
- int [wifi_fast_connect_start](#) (uint8_t ap_index)
Start fast connect mechanism.
- int [wifi_get_config](#) (wifi_mode_t interface, wifi_config_t *conf)
Get configuration of specified interface.
- int [wifi_init](#) (const wifi_init_config_t *config, wifi_init_complete_cb_t init_cb)

- Init Wi-Fi Initializes the wifi according to the specified parameters in the config.*
- int [wifi_scan_get_ap_list](#) ([wifi_scan_list_t](#) *scan_list)
Get list of APs that found in last scan operation.
- int [wifi_scan_get_ap_num](#) (uint16_t *number)
Get the number of scanned APs.
- int [wifi_scan_get_ap_records](#) (uint16_t *number, [wifi_scan_info_t](#) *ap_records)
Get AP list found in last scan operation.
- int [wifi_scan_scan_stop](#) (void)
Stop scanning process.
- int [wifi_scan_start](#) (const [wifi_scan_config_t](#) *config, bool block)
Scan all available APs. After invoke the [wifi_set_config\(\)](#) and [wifi_start\(\)](#), then call [wifi_scan_start\(\)](#) to scan APs.
- int [wifi_set_config](#) ([wifi_mode_t](#) interface, [wifi_config_t](#) *conf)
Set configuration of OPL1000 STA.
- int [wifi_sta_get_ap_info](#) ([wifi_ap_record_t](#) *ap_info)
Get information of AP which OPL1000 station is associated with.
- int [wifi_start](#) (void)
Start Wi-Fi working.
- int [wifi_stop](#) (void)
Stop wifi working.

```

4.9.3.27 `wifi_connection_disconnect_ap_fp_t`

```
typedef int(* wifi_connection_disconnect_ap_fp_t) (void)
```

4.9.3.28 `wifi_connection_disconnect_sta_fp_t`

```
typedef int(* wifi_connection_disconnect_sta_fp_t) (uint8_t *address)
```

4.9.3.29 `wifi_connection_get_rssi_fp_t`

```
typedef int(* wifi_connection_get_rssi_fp_t) (int8_t *rssi)
```

4.9.3.30 `wifi_connection_register_event_handler_fp_t`

```
typedef int(* wifi_connection_register_event_handler_fp_t) (wifi\_event\_t event, wifi\_event\_handler\_t handler)
```

4.9.3.31 `wifi_connection_scan_start_fp_t`

```
typedef int(* wifi_connection_scan_start_fp_t) (uint8_t *ssid, uint8_t ssid_length, uint8_t *bssid, uint8_t scan_mode, uint8_t scan_option)
```

4.9.3.32 `wifi_connection_unregister_event_handler_fp_t`

```
typedef int(* wifi_connection_unregister_event_handler_fp_t) (wifi\_event\_t event, wifi\_event\_handler\_t handler)
```

4.9.3.33 wifi_convert_auth_mode_fp_t

```
typedef int(* wifi_convert_auth_mode_fp_t) (int wpa_pro, int privacy)
```

4.9.3.34 wifi_deinit_fp_t

```
typedef int(* wifi_deinit_fp_t) (void)
```

4.9.3.35 wifi_event_handler_t

```
typedef int32_t(* wifi_event_handler_t) (wifi_event_t event, uint8_t *payload, uint32_t length)
```

This defines the Wi-Fi event handler. Call [wifi_connection_register_event_handler\(\)](#) to register a handler, then the Wi-Fi driver generates an event and sends it to the handler.

Parameters

in	<i>event</i>	is an optional event to register. For more details, please refer to wifi_event_t .
in	<i>payload</i>	is the payload for the event. When the event is WIFI_EVENT_IOT_CONNECTED in AP mode, payload is the connected STA's MAC address. When the event is WIFI_EVENT_IOT_CONNECTED in STA mode, payload is the connected AP's BSSID.
in	<i>length</i>	is the length of a packet.

Returns

The return value is reserved and it is ignored.

4.9.3.36 wifi_fast_connect_get_mode_fp_t

```
typedef int(* wifi_fast_connect_get_mode_fp_t) (uint8_t ap_index, uint8_t *mode)
```

4.9.3.37 wifi_fast_connect_set_mode_fp_t

```
typedef int(* wifi_fast_connect_set_mode_fp_t) (uint8_t ap_index, uint8_t mode)
```

4.9.3.38 `wifi_fast_connect_start_fp_t`

```
typedef int(* wifi_fast_connect_start_fp_t) (uint8_t ap_index)
```

4.9.3.39 `wifi_get_config_fp_t`

```
typedef int(* wifi_get_config_fp_t) (wifi_mode_t interface, wifi_config_t *conf)
```

4.9.3.40 `wifi_init_complete_cb_t`

```
typedef void(* wifi_init_complete_cb_t) (void *ctx)
```

Initialization of complete callback function.

Invoked when Wi-Fi initialization is complete.

Parameters

<code>ctx</code>	is context pointer that provided to <code>wifi_init()</code> . It will be passed back to the callback.
------------------	--

4.9.3.41 `wifi_init_fp_t`

```
typedef int(* wifi_init_fp_t) (const wifi_init_config_t *config, wifi_init_complete_cb_t init↔  
_cb)
```

4.9.3.42 `wifi_result_t`

```
typedef int32_t wifi_result_t
```

4.9.3.43 `wifi_scan_get_ap_list_fp_t`

```
typedef int(* wifi_scan_get_ap_list_fp_t) (wifi_scan_list_t *scan_list)
```

4.9.3.44 wifi_scan_get_ap_num_fp_t

```
typedef int(* wifi_scan_get_ap_num_fp_t) (uint16_t *number)
```

4.9.3.45 wifi_scan_get_ap_records_fp_t

```
typedef int(* wifi_scan_get_ap_records_fp_t) (uint16_t *number, wifi\_scan\_info\_t *ap_records)
```

4.9.3.46 wifi_scan_start_fp_t

```
typedef int(* wifi_scan_start_fp_t) (const wifi\_scan\_config\_t *config, bool block)
```

4.9.3.47 wifi_scan_stop_fp_t

```
typedef int(* wifi_scan_stop_fp_t) (void)
```

4.9.3.48 wifi_set_config_fp_t

```
typedef int(* wifi_set_config_fp_t) (wifi\_mode\_t interface, wifi\_config\_t *conf)
```

4.9.3.49 wifi_sta_get_ap_info_fp_t

```
typedef int(* wifi_sta_get_ap_info_fp_t) (wifi\_ap\_record\_t *ap_info)
```

4.9.3.50 wifi_start_fp_t

```
typedef int(* wifi_start_fp_t) (void)
```

4.9.3.51 wifi_stop_fp_t

```
typedef int(* wifi_stop_fp_t) (void)
```

4.9.4 Function Documentation

4.9.4.1 `wifi_auto_connect_clear_ap_info()`

```
int wifi_auto_connect_clear_ap_info (
    uint8_t index )
```

Clear the AP information which index in the.

Attention

1. API returns false if try to clear AP information which something error

Parameters

in	<i>index</i>	The index of AP position <ul style="list-style-type: none"> • Range is 0 to 2
----	--------------	--

Returns

0 : success
other : failed

4.9.4.2 `wifi_auto_connect_get_ap_info()`

```
int wifi_auto_connect_get_ap_info (
    uint8_t index,
    wifi_auto_connect_info_t * info )
```

Get the AP information.

Attention

1. API returns false if try to get AP information which something error

Parameters

in	<i>index</i>	The index of AP position <ul style="list-style-type: none"> • Range is 0 to 2
out	<i>mode</i>	Get the AP information

Returns

0 : success
other : failed

4.9.4.3 wifi_auto_connect_get_ap_num()

```
int wifi_auto_connect_get_ap_num (
    uint8_t * num )
```

Get the maximum number of AP information.

Attention

1. API returns false if try to get maximum auto connect numbers which something error

Parameters

out	<i>num</i>	Get the maximum number of AP information
-----	------------	--

Returns

0 : success
other : failed

4.9.4.4 wifi_auto_connect_get_mode()

```
int wifi_auto_connect_get_mode (
    uint8_t * mode )
```

Get the auto connect mode.

Attention

1. API returns false if try to get auto connect mode which something error

Parameters

out	<i>mode</i>	Get the auto connect mode
-----	-------------	---------------------------

Returns

0 : success
other : failed

4.9.4.5 wifi_auto_connect_get_saved_ap_num()

```
int wifi_auto_connect_get_saved_ap_num (
    uint8_t * num )
```

Get the current number of AP save in flash.

Attention

1. API returns false if try to get current auto connect numbers which something error

Parameters

out	num	The current number of AP information will be saved in flash.
-----	-----	--

Returns

0 : success
other : failed

4.9.4.6 wifi_auto_connect_init()

```
int wifi_auto_connect_init (
    void )
```

Initialize function of auto connect.

Attention

1. API returns false if try to initial auto connect which something error

Returns

0 : success
other : failed

4.9.4.7 wifi_auto_connect_reset()

```
int wifi_auto_connect_reset (
    void )
```

Reset all of auto/fast connect configuration.

Attention

1. API returns false if try to reset auto connect configuration which something error

Returns

0 : success
other : failed

4.9.4.8 wifi_auto_connect_set_ap_num()

```
int wifi_auto_connect_set_ap_num (
    uint8_t num )
```

Set the maximum number of AP information.

Attention

1. API returns false if try to set maximum auto connect numbers which something error

Parameters

in	num	The maximum number of AP information will be saved in flash. <ul style="list-style-type: none">• Range is 1 to 3
----	-----	--

Returns

0 : success
other : failed

4.9.4.9 wifi_auto_connect_set_mode()

```
int wifi_auto_connect_set_mode (
    uint8_t mode )
```

Set the auto connect mode.

Attention

1. API returns false if try to set auto connect mode which something error

Parameters

in	mode	Configure the current wifi working mode,The options are <ul style="list-style-type: none">• WIFI_AUTO_CONNECT_ENABLE• WIFI_AUTO_CONNECT_DISABLE
----	------	--

Returns

0 : success
other : failed

4.9.4.10 wifi_auto_connect_start()

```
int wifi_auto_connect_start (
    void )
```

Start auto connect mechanism.

Attention

1. API returns false if try to start auto connect function which something error

Returns

0 : success
other : failed

4.9.4.11 wifi_auto_connect_update_ch()

```
int wifi_auto_connect_update_ch (
    uint8_t ac_index,
    uint8_t channel )
```

Update the channel which AP index in auto connect list.

Attention

1. API returns false if update channel which something error

Parameters

in	<i>index</i>	The index of AP position • Range is 0 to 2
in	<i>channel</i>	The channel of AP's used. • Range is 1 to 14

Returns

0 : success
other : failed

4.9.4.12 wifi_config_get_bandwidth()

```
int wifi_config_get_bandwidth (
    wifi_mode_t interface,
    wifi_bandwidth_t * bandwidth )
```

Get the bandwidth of OPL1000 specified interface.

Attention

1. API returns false if try to get an interface which is not enable

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
out	<i>bandwidth</i>	Get the bandwidth value of the current wifi module working through the pointer

Returns

0 : success
other : failed

4.9.4.13 wifi_config_get_bssid()

```
int wifi_config_get_bssid (
    uint8_t * bssid )
```

get bssid after scan

Parameters

out	<i>bssid</i>	the string of bssid
-----	--------------	---------------------

Returns

0 : success
other : failed

4.9.4.14 wifi_config_get_channel()

```
int wifi_config_get_channel (
    wifi_mode_t interface,
    uint8_t * channel )
```

Get the primary/secondary channel of OPL1000.

Attention

1. API returns false if try to get an interface which is not enabled

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
out	<i>channel</i>	Get Current module wifi work channel number

Returns

0 : success
other : failed

4.9.4.15 wifi_config_get_dtim_interval()

```
int wifi_config_get_dtim_interval (
    uint8_t * interval )
```

4.9.4.16 wifi_config_get_listen_interval()

```
int wifi_config_get_listen_interval (
    uint8_t * interval )
```

4.9.4.17 wifi_config_get_mac_address()

```
int wifi_config_get_mac_address (
    wifi_mode_t interface,
    uint8_t * address )
```

Get mac of specified interface.

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
out	<i>address</i>	Get the MAC address of the device through this interface, The address is similar to this structure: xx:xx:xx:xx:xx:xx

Returns

0 : success
other : failed

4.9.4.18 wifi_config_get_mac_tx_data_rate()

```
int wifi_config_get_mac_tx_data_rate (
    wifi_mac_data_rate_t * data_rate )
```

Get the Mac tx data rate in current wifi setting of OPL1000.

Parameters

out	<i>data_rate</i>	Get the Mac tx data rate <ul style="list-style-type: none">• WIFI_MAC_DATA_RATE_ARA• WIFI_MAC_DATA_RATE_1M• WIFI_MAC_DATA_RATE_2M• WIFI_MAC_DATA_RATE_5_5M• WIFI_MAC_DATA_RATE_11M
-----	------------------	--

Returns

0 : success
other : failed

4.9.4.19 wifi_config_get_opmode()

```
int wifi_config_get_opmode (
    uint8_t * mode )
```

4.9.4.20 wifi_config_get_skip_dtim()

```
int wifi_config_get_skip_dtim (
    uint8_t * value )
```

Get the Skip DTIM value in current wifi setting of OPL1000.

Parameters

out	<i>value</i>	Get the Skip DTIM value in current wifi setting
-----	--------------	---

Returns

0 : success
other : failed

4.9.4.21 wifi_config_get_ssid()

```
int wifi_config_get_ssid (
    uint8_t * ssid,
    uint8_t * ssid_length )
```

Get ssid value of AP.

Parameters

out	<i>ssid</i>	Get ssid by pointer
out	<i>ssid_length</i>	Get the length of the ssid character

Returns

0 : success
other : failed

4.9.4.22 wifi_config_get_sta_mac_address_from_flash()

```
int wifi_config_get_sta_mac_address_from_flash (
    uint8_t * bssid )
```

Get mac address of station from flash.

Parameters

out	<i>address</i>	Get the MAC address of station from flash, The address is similar to this structure: xx:xx:xx:xx:xx:xx
-----	----------------	---

Returns

0 : success
other : failed

4.9.4.23 wifi_config_set_bandwidth()

```
int wifi_config_set_bandwidth (
    wifi_mode_t interface,
    wifi_bandwidth_t bandwidth )
```

Set the bandwidth of OPL1000 specified interface.

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none">• WIFI_MODE_STA• WIFI_MODE_AP (currently not support)
in	<i>bandwidth</i>	Set the working bandwidth of wifi

Returns

0 : success
other : failed

4.9.4.24 wifi_config_set_bssid()

```
int wifi_config_set_bssid (  
    uint8_t * bssid )
```

config OPL1000 Wi-Fi bssid.

Parameters

in	<i>bssid</i>	the string of bssid
----	--------------	---------------------

Returns

0 : success
other : failed

4.9.4.25 wifi_config_set_channel()

```
int wifi_config_set_channel (  
    wifi_mode_t interface,  
    uint8_t channel )
```

Set primary/secondary channel of OPL1000.

Attention

1. This is a special API for sniffer
2. This API should be called after [wifi_start\(\)](#)

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
in	<i>channel</i>	Set current Wi-Fi work channel number

Returns

0 : success
other : failed

4.9.4.26 wifi_config_set_dtim_interval()

```
int wifi_config_set_dtim_interval (
    uint8_t interval )
```

4.9.4.27 wifi_config_set_listen_interval()

```
int wifi_config_set_listen_interval (
    uint8_t interval )
```

4.9.4.28 wifi_config_set_mac_address()

```
int wifi_config_set_mac_address (
    wifi_mode_t interface,
    uint8_t * address )
```

Set MAC address of OPL1000 Wi-Fi station or the soft-AP interface.

Attention

1. This API can only be called when the interface is disabled
2. OPL1000 soft-AP and station have different MAC addresses, do not set them to be the same.

Parameters

in	<i>interface</i>	Configure the current wifi working mode,The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
in	<i>address</i>	set MAC address

Returns

0 : success
other : failed

4.9.4.29 wifi_config_set_mac_tx_data_rate()

```
int wifi_config_set_mac_tx_data_rate (
    wifi_mac_data_rate_t data_rate )
```

Set the Mac tx data rate setting of OPL1000.

Parameters

in	<i>data_rate</i>	Set the Mac tx data rate
		<ul style="list-style-type: none">• WIFI_MAC_DATA_RATE_ARA• WIFI_MAC_DATA_RATE_1M• WIFI_MAC_DATA_RATE_2M• WIFI_MAC_DATA_RATE_5_5M• WIFI_MAC_DATA_RATE_11M

Returns

0 : success
other : failed

4.9.4.30 wifi_config_set_opmode()

```
int wifi_config_set_opmode (
    uint8_t mode )
```

4.9.4.31 wifi_config_set_skip_dtim()

```
int wifi_config_set_skip_dtim (
    uint8_t value,
    bool save_flash )
```

Set the Skip DTIM value of OPL1000.

Parameters

in	<i>value</i>	Set the Skip DTIM value
in	<i>save_flash</i>	Enable/Disable to write in flash. <ul style="list-style-type: none"> • 0 : Not write in flash. (Only effect in runtime) • 1 : Write in flash and effect the value.

Attention

1. This API will set the skip DTIM value to share memory and stored in flash, please use [wifi_config_get_skip_dtim\(\)](#) to check it.
2. The setting will be effect after next connect. We recommend re-connect AP after setting to make sure the value is correct with negotiate between AP.

Returns

0 : success
other : failed

4.9.4.32 wifi_config_set_ssid()

```
int wifi_config_set_ssid (
    wifi_mode_t interface,
    uint8_t * ssid,
    uint8_t ssid_length )
```

Set the ssid value of the current device.

Parameters

in	<i>interface</i>	Configure the current wifi working mode, The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
in	<i>ssid</i>	Set the value of ssid
in	<i>ssid_length</i>	The length of ssid parameter

Returns

0 : success
other : failed

4.9.4.33 wifi_connection_connect()

```
int wifi_connection_connect (
    wifi_config_t * config )
```

Connect OPL1000 Wi-Fi station to certain AP.

Attention

1. This API only impact WIFI_MODE_STA or WIFI_MODE_AP mode
2. If OPL1000 is connected to an AP, call wifi_disconnect to disconnect.

Parameters

in	<i>config</i>	Establish connection parameters
----	---------------	---------------------------------

Returns

0 : success
other : failed

4.9.4.34 wifi_connection_connect_from_ac_index()

```
int wifi_connection_connect_from_ac_index (
    uint8_t index )
```

Connect OPL1000 Wi-Fi station to certain AP by auto connect index.

Attention

1. This API only impact WIFI_MODE_STA or WIFI_MODE_AP mode
2. If OPL1000 is connected to an AP, call wifi_disconnect to disconnect.
3. Then index should be 0 to begin.

Parameters

in	<i>index</i>	The index of AP in auto connect list
----	--------------	--------------------------------------

Returns

0 : success
1 : The index of AP is null
other : failed

4.9.4.35 `wifi_connection_connect_from_ac_list()`

```
int wifi_connection_connect_from_ac_list (
    wifi_config_t * config )
```

Connect OPL1000 Wi-Fi station to certain AP in auto connect list.

Attention

1. This API only impact WIFI_MODE_STA or WIFI_MODE_AP mode
2. If OPL1000 is connected to an AP, call `wifi_disconnect` to disconnect.

Parameters

in	<i>config</i>	Establish connection parameters
----	---------------	---------------------------------

Returns

0 : success
1 : Not found in list
other : failed

4.9.4.36 `wifi_connection_disconnect_ap()`

```
int wifi_connection_disconnect_ap (
    void )
```

Disconnect the link between OPL1000 and connected AP.

Returns

0 : success
other : failed

4.9.4.37 `wifi_connection_disconnect_sta()`

```
int wifi_connection_disconnect_sta (
    uint8_t * address )
```

Disconnect the link between the current device and the station.

Parameters

in	<i>address</i>	station address
----	----------------	-----------------

Returns

0 : success
other : failed

4.9.4.38 wifi_connection_get_rssi()

```
int wifi_connection_get_rssi (
    int8_t * rssi )
```

get signal strength of AP

Attention

1. If the scan is successful, this API returns signal strength value, otherwise it will get wrong result

Parameters

out	<i>rssi</i>	rssi value
-----	-------------	------------

Returns

0 : success
other : failed

4.9.4.39 wifi_connection_register_event_handler()

```
int wifi_connection_register_event_handler (
    wifi_event_t event,
    wifi_event_handler_t handler )
```

register wifi call back handler

Parameters

in	<i>event</i>	The type of the registered event. Options are <ul style="list-style-type: none"> • WIFI_EVENT_INIT_COMPLETE • WIFI_EVENT_SCAN_COMPLETE • WIFI_EVENT_STA_START • WIFI_EVENT_STA_STOP • WIFI_EVENT_STA_CONNECTED • WIFI_EVENT_STA_DISCONNECTED • WIFI_EVENT_STA_CONNECTION_FAILED • WIFI_EVENT_STA_GOT_IP
in	<i>handler</i>	registered event handler

Returns

0 : success
other : failed

4.9.4.40 wifi_connection_scan_start()

```
int wifi_connection_scan_start (
    uint8_t * ssid,
    uint8_t ssid_length,
    uint8_t * bssid,
    uint8_t scan_mode,
    uint8_t scan_option )
```

4.9.4.41 wifi_connection_unregister_event_handler()

```
int wifi_connection_unregister_event_handler (
    wifi_event_t event,
    wifi_event_handler_t handler )
```

unregister wifi call back handler

Parameters

in	<i>event</i>	The type of the unregistered event. Options please refer to wifi_connection_register_event_handler()
in	<i>handler</i>	unregistered event handler

Returns

0 : success
other : failed

4.9.4.42 wifi_convert_auth_mode()

```
int wifi_convert_auth_mode (
    int wpa_pro,
    int privacy )
```

4.9.4.43 wifi_deinit()

```
int wifi_deinit (
    void )
```

De-init Wi-Fi Initialization and Configuration functions.

Attention

1. This API should be called if want to remove Wi-Fi driver from the system

Returns

0 : success
other : failed

4.9.4.44 wifi_fast_connect_get_mode()

```
int wifi_fast_connect_get_mode (
    uint8_t ap_index,
    uint8_t * mode )
```

Get the fast connect mode.

Attention

1. API returns false if try to get fast connect mode which something error

Parameters

in	<i>index</i>	The index of AP position • Range is 0 to 2
out	<i>mode</i>	Get the fast connect mode

Returns

0 : success
other : failed

4.9.4.45 wifi_fast_connect_set_mode()

```
int wifi_fast_connect_set_mode (
    uint8_t ap_index,
    uint8_t mode )
```

Set the fast connect mode.

Attention

1. API returns false if try to set fast connect mode which something error

Parameters

in	<i>index</i>	The index of AP position • Range is 0 to 2
in	<i>mode</i>	The fast connect mode

Returns

0 : success
other : failed

4.9.4.46 wifi_fast_connect_start()

```
int wifi_fast_connect_start (
    uint8_t ap_index )
```

Start fast connect mechanism.

Attention

1. API returns false if try to start fast connect function which something error

Parameters

in	<i>index</i>	The index of AP position <ul style="list-style-type: none">• Range is 0 to 2
----	--------------	--

Returns

0 : success
other : failed

4.9.4.47 wifi_get_config()

```
int wifi_get_config (
    wifi_mode_t interface,
    wifi_config_t * conf )
```

Get configuration of specified interface.

Parameters

in	<i>interface</i>	Configure wifi working mode, The options are <ul style="list-style-type: none">• WIFI_MODE_STA• WIFI_MODE_AP (currently not support)
out	<i>conf</i>	return wifi's current operating parameters

Returns

0 : success
other : failed

4.9.4.48 wifi_init()

```
int wifi_init (
    const wifi_init_config_t * config,
    wifi_init_complete_cb_t init_cb )
```

Init Wi-Fi Initializes the wifi according to the specified parameters in the config.

Attention

1. This API must be called before other Wi-Fi APIs are invoked

Parameters

in	<i>config</i>	pointer to Wi-Fi init configuration structure; can point to a temporary variable.
in	<i>init_cb</i>	pointer to Wi-Fi init complete configuration structure; can point to a temporary variable.

Returns

0 : success
other : failed

4.9.4.49 wifi_scan_get_ap_list()

```
int wifi_scan_get_ap_list (
    wifi_scan_list_t * scan_list )
```

Get list of APs that found in last scan operation.

Attention

This API only be called when scan is completed, otherwise it may get wrong value.

Parameters

out	<i>scan_list</i>	store APs' informaton that found in last scan operation
-----	------------------	---

Returns

0 : success
other : failed

4.9.4.50 wifi_scan_get_ap_num()

```
int wifi_scan_get_ap_num (
    uint16_t * number )
```

Get the number of scanned APs.

Parameters

out	<i>number</i>	store number of APs found in last scan operation
-----	---------------	--

Attention

This API only be called when scan is completed, otherwise it may get wrong value.

Returns

the scan result of AP number

4.9.4.51 `wifi_scan_get_ap_records()`

```
int wifi_scan_get_ap_records (
    uint16_t * number,
    wifi_scan_info_t * ap_records )
```

Get AP list found in last scan operation.

Parameters

out	<i>number</i>	As input param, it stores max AP number that <code>ap_records</code> can hold. As output param, it receives the actual AP number that this API returns.
out	<i>ap_records</i>	<code>wifi_scan_info_t</code> array stores the found APs

Returns

0 : success
other : failed

4.9.4.52 `wifi_scan_scan_stop()`

```
int wifi_scan_scan_stop (
    void )
```

Stop scanning process.

Attention

This API shall be called after `wifi_scan_start()`

Returns

0 : success
other : failed

4.9.4.53 `wifi_scan_start()`

```
int wifi_scan_start (
    const wifi_scan_config_t * config,
    bool block )
```

Scan all available APs. After invoke the `wifi_set_config()` and `wifi_start()`, then call `wifi_scan_start()` to scan APs.

Parameters

in	<i>config</i>	Configure parameters for scan operation
in	<i>block</i>	if block is true, this API blocks the caller until scan operation is done, otherwise it returns immediately

Returns

0 : success
other : failed

4.9.4.54 wifi_set_config()

```
int wifi_set_config (
    wifi_mode_t interface,
    wifi_config_t * conf )
```

Set configuration of OPL1000 STA.

Attention

1. This API is called only when specified interface is enabled, otherwise API calling will be failed
2. For station configuration, bssid_set shall be set to 0; set to 1 means user want to check MAC address of certain AP.
3. OPL1000 is limited to working on one channel.

Parameters

in	<i>interface</i>	Configure wifi working mode, The options are <ul style="list-style-type: none"> • WIFI_MODE_STA • WIFI_MODE_AP (currently not support)
in	<i>conf</i>	structure of configuration paremeters

Returns

0 : success
other : failed

4.9.4.55 wifi_sta_get_ap_info()

```
int wifi_sta_get_ap_info (
    wifi_ap_record_t * ap_info )
```

Get information of AP which OPL1000 station is associated with.

Parameters

out	<i>ap_info</i>	get AP information from list
-----	----------------	------------------------------

Returns

0 : success
other : failed

4.9.4.56 wifi_start()

```
int wifi_start (
    void )
```

Start Wi-Fi working.

- If mode is WIFI_MODE_STA, it creates station control block and starts station

Returns

0 : success
other : failed

4.9.4.57 wifi_stop()

```
int wifi_stop (
    void )
```

Stop wifi working.

- If mode is WIFI_MODE_STA, it stops station and releases station control block

Returns

0 : success
other : failed

4.9.5 Variable Documentation

4.10 Enumeration

Enumerations

- enum `wifi_auth_mode_t` {
`WIFI_AUTH_OPEN` = 0, `WIFI_AUTH_WEP`, `WIFI_AUTH_WPA_PSK`, `WIFI_AUTH_WPA2_PSK`,
`WIFI_AUTH_WPA_WPA2_PSK`, `WIFI_AUTH_WPA2_ENTERPRISE` }

This enumeration defines the wireless authentication mode to indicate the Wi-Fi device authentication attribute.

- enum `wifi_bandwidth_t` { `WIFI_BW_HT20` = 1, `WIFI_BW_HT40` }
- enum `wifi_cipher_type_t` {
`WIFI_CIPHER_TYPE_NONE` = 0, `WIFI_CIPHER_TYPE_WEP40`, `WIFI_CIPHER_TYPE_WEP104`,
`WIFI_CIPHER_TYPE_TKIP`,
`WIFI_CIPHER_TYPE_CCMP`, `WIFI_CIPHER_TYPE_TKIP_CCMP`, `WIFI_CIPHER_TYPE_UNKNOWN` }

This enumeration defines wireless security cipher suits.

- enum `wifi_event_t` {
`WIFI_EVENT_NONE` = -1, `WIFI_EVENT_INIT_COMPLETE` = 0, `WIFI_EVENT_SCAN_COMPLETE`,
`WIFI_EVENT_STA_START`,
`WIFI_EVENT_STA_STOP`, `WIFI_EVENT_STA_CONNECTED`, `WIFI_EVENT_STA_DISCONNECTED`,
`WIFI_EVENT_STA_CONNECTION_FAILED`,
`WIFI_EVENT_STA_GOT_IP`, `WIFI_EVENT_STA_AUTO_CONNECT_FAILED`, `WIFI_EVENT_MAX` }

This enumeration defines the supported events generated by the Wi-Fi driver. The event will be sent to the upper layer handler registered in `wifi_register_event_handler()`.

- enum `wifi_mac_data_rate_t` {
`WIFI_MAC_DATA_RATE_ARA` = 0, `WIFI_MAC_DATA_RATE_1M`, `WIFI_MAC_DATA_RATE_2M`,
`WIFI_MAC_DATA_RATE_5_5M`,
`WIFI_MAC_DATA_RATE_11M` }

This enumeration defines wifi mac tx data rates..

- enum `wifi_mode_t` { `WIFI_MODE_NULL` = 0, `WIFI_MODE_STA`, `WIFI_MODE_AP`, `WIFI_MODE_MAX` }

- enum `wifi_reason_code_t` {
`WIFI_REASON_CODE_SUCCESS`, `WIFI_REASON_CODE_FIND_AP_FAIL`, `WIFI_REASON_CODE_PREV_AUTH_INVALID`,
`WIFI_REASON_CODE_DEAUTH_LEAVING_BSS`,
`WIFI_REASON_CODE_DISASSOC_INACTIVITY`, `WIFI_REASON_CODE_DISASSOC_AP_OVERLOAD`,
`WIFI_REASON_CODE_CLASS_2_ERR`, `WIFI_REASON_CODE_CLASS_3_ERR`,
`WIFI_REASON_CODE_DISASSOC_LEAVING_BSS`, `WIFI_REASON_CODE_ASSOC_BEFORE_AUTH`,
`WIFI_REASON_CODE_DISASSOC_PWR_CAP_UNACCEPTABLE`, `WIFI_REASON_CODE_DISASSOC_SUP_CHS_UNACCO`,
`WIFI_REASON_CODE_INVALID_INFO_ELEM` = 13, `WIFI_REASON_CODE_MIC_FAILURE`, `WIFI_REASON_CODE_4_WAY`,
`WIFI_REASON_CODE_GROUP_KEY_UPDATE_TIMEOUT`,
`WIFI_REASON_CODE_DIFFERENT_INFO_ELEM`, `WIFI_REASON_CODE_GROUP_CIPHER_INVALID_VALID`,
`WIFI_REASON_CODE_PAIRWISE_CIPHER_INVALID`, `WIFI_REASON_CODE_AKMP_INVALID`,
`WIFI_REASON_CODE_UNSUPPORTED_RSNE_VERSION`, `WIFI_REASON_CODE_INVALID_RSNE_CAPABILITIES`,
`WIFI_REASON_CODE_IEEE_802_1X_AUTH_FAILED`, `WIFI_REASON_CODE_CIPHER_REJECTED`,
`WIFI_REASON_CODE_AUTO_CONNECT_FAILED` = 200, `WIFI_REASON_CODE_CONNECT_NOT_FOUND`,
`WIFI_REASON_CODE_CONNECT_TIMEOUT` }

This enumeration defines the reason code of the `WIFI_EVENT_STA_CONNECTION_FAILED` event in `wifi_event_t`.

Find the details for the reason code below.

- enum `wifi_scan_method_t` { `WIFI_FAST_SCAN` = 0, `WIFI_ALL_CHANNEL_SCAN` }
- enum `wifi_scan_type_t` { `WIFI_SCAN_TYPE_ACTIVE` = 0, `WIFI_SCAN_TYPE_PASSIVE`, `WIFI_SCAN_TYPE_MIX` }

This enumeration defines the wireless STA scan type.

- enum `wifi_sort_method_t` { `WIFI_CONNECT_AP_BY_SIGNAL` = 0, `WIFI_CONNECT_AP_BY_SECURITY` }

4.10.1 Detailed Description

4.10.2 Enumeration Type Documentation

4.10.2.1 wifi_auth_mode_t

```
enum wifi_auth_mode_t
```

This enumeration defines the wireless authentication mode to indicate the Wi-Fi device authentication attribute.

Enumerator

WIFI_AUTH_OPEN	authenticate mode : open
WIFI_AUTH_WEP	authenticate mode : WEP
WIFI_AUTH_WPA_PSK	authenticate mode : WPA_PSK
WIFI_AUTH_WPA2_PSK	authenticate mode : WPA2_PSK
WIFI_AUTH_WPA_WPA2_PSK	authenticate mode : WPA_WPA2_PSK
WIFI_AUTH_WPA2_ENTERPRISE	authenticate mode : WPA2_ENTERPRISE

4.10.2.2 wifi_bandwidth_t

```
enum wifi_bandwidth_t
```

Enumerator

WIFI_BW_HT20	Bandwidth is HT20
WIFI_BW_HT40	Bandwidth is HT40

4.10.2.3 wifi_cipher_type_t

```
enum wifi_cipher_type_t
```

This enumeration defines wireless security cipher suits.

Enumerator

WIFI_CIPHER_TYPE_NONE	0, the cipher type is none
WIFI_CIPHER_TYPE_WEP40	1, the cipher type is WEP40
WIFI_CIPHER_TYPE_WEP104	2, the cipher type is WEP104
WIFI_CIPHER_TYPE_TKIP	3, the cipher type is TKIP
WIFI_CIPHER_TYPE_CCMP	4, the cipher type is CCMP
WIFI_CIPHER_TYPE_TKIP_CCMP	5, the cipher type is TKIP and CCMP
WIFI_CIPHER_TYPE_UNKNOWN	6, the cipher type is unknown

4.10.2.4 `wifi_event_t`

```
enum wifi_event_t
```

This enumeration defines the supported events generated by the Wi-Fi driver. The event will be sent to the upper layer handler registered in [wifi_register_event_handler\(\)](#).

Enumerator

WIFI_EVENT_NONE	Reserved
WIFI_EVENT_INIT_COMPLETE	Wi-Fi initialization complete event.
WIFI_EVENT_SCAN_COMPLETE	Scan completed event
WIFI_EVENT_STA_START	station start
WIFI_EVENT_STA_STOP	station stop
WIFI_EVENT_STA_CONNECTED	station connected to AP event
WIFI_EVENT_STA_DISCONNECTED	station disconnected from AP
WIFI_EVENT_STA_CONNECTION_FAILED	Connection has failed. For the reason code, please refer to wifi_reason_code_t .
WIFI_EVENT_STA_GOT_IP	station got IP from connected AP
WIFI_EVENT_STA_AUTO_CONNECT_FAILED	station auto connect failed indication
WIFI_EVENT_MAX	

4.10.2.5 `wifi_mac_data_rate_t`

```
enum wifi_mac_data_rate_t
```

This enumeration defines wifi mac tx data rates..

Enumerator

WIFI_MAC_DATA_RATE_ARA	Auto Rate Adaptation
WIFI_MAC_DATA_RATE_1M	Fix Mac Tx data rate in 1 Mbps
WIFI_MAC_DATA_RATE_2M	Fix Mac Tx data rate in 2 Mbps
WIFI_MAC_DATA_RATE_5_5M	Fix Mac Tx data rate in 5.5 Mbps
WIFI_MAC_DATA_RATE_11M	Fix Mac Tx data rate in 11 Mbps

4.10.2.6 `wifi_mode_t`

```
enum wifi_mode_t
```

Enumerator

WIFI_MODE_NULL	null mode
WIFI_MODE_STA	Wi-Fi station mode
WIFI_MODE_AP	Wi-Fi soft-AP mode
WIFI_MODE_MAX	

4.10.2.7 wifi_reason_code_t

```
enum wifi_reason_code_t
```

This enumeration defines the reason code of the WIFI_EVENT_STA_CONNECTION_FAILED event in [wifi_event_t](#). Find the details for the reason code below.

Enumerator

WIFI_REASON_CODE_SUCCESS	0 Reserved.
WIFI_REASON_CODE_FIND_AP_FAIL	1 (Internal) No AP found.
WIFI_REASON_CODE_PREV_AUTH_INVALID	2 Previous authentication is no longer valid.
WIFI_REASON_CODE_DEAUTH_LEAVING_BSS	3 Deauthenticated because sending STA is leaving (or has left) IBSS or ES.
WIFI_REASON_CODE_DISASSOC_INACTIVITY	4 Disassociated due to inactivity.
WIFI_REASON_CODE_DISASSOC_AP_OVERLOAD	5 Disassociated because AP is unable to handle all currently associated STAs.
WIFI_REASON_CODE_CLASS_2_ERR	6 Class 2 frame received from nonauthenticated STA.
WIFI_REASON_CODE_CLASS_3_ERR	7 Class 3 frame received from nonauthenticated STA.
WIFI_REASON_CODE_DISASSOC_LEAVING_BSS	8 Disassociated because sending STA is leaving (or has left) BSS.
WIFI_REASON_CODE_ASSOC_BEFORE_AUTH	9 STA requesting (re)association is not authenticated with responding STA.
WIFI_REASON_CODE_DISASSOC_PWR_CAP_UNACCEPTABLE	10 Disassociated because the information in the Power Capability element is unacceptable.
WIFI_REASON_CODE_DISASSOC_SUP_CHS_UNACCEPTABLE	11 Disassociated because the information in the Supported Channels element is unacceptable.
WIFI_REASON_CODE_INVALID_INFO_ELEM	13 Invalid information element.
WIFI_REASON_CODE_MIC_FAILURE	14 Message integrity code (MIC) failure.
WIFI_REASON_CODE_4_WAY_HANDSHAKE_TIMEOUT	15 4-Way Handshake time out.
WIFI_REASON_CODE_GROUP_KEY_UPDATE_TIMEOUT	16 Group Key Handshake time out.
WIFI_REASON_CODE_DIFFERENT_INFO_ELEM	17 Information element in 4-Way Handshake different from (Re)Association Request/Probe Response/Beacon frame.
WIFI_REASON_CODE_GROUP_CIPHER_INVALID	18 Invalid group cipher.
WIFI_REASON_CODE_PAIRWISE_CIPHER_INVALID	19 Invalid pairwise cipher.
WIFI_REASON_CODE_AKMP_INVALID	20 Invalid AKMP.
WIFI_REASON_CODE_UNSUPPORTED_RSNE_VERSION	21 Unsupported RSN information element version.
WIFI_REASON_CODE_INVALID_RSNE_CAPABILITIES	22 Invalid RSN information element capabilities.
WIFI_REASON_CODE_IEEE_802_1X_AUTH_FAILED	23 IEEE 802.1X authentication failed.
WIFI_REASON_CODE_CIPHER_REJECTED	24 Cipher suite rejected because of the security policy.
WIFI_REASON_CODE_AUTO_CONNECT_FAILED	200 Auto connect failed.
WIFI_REASON_CODE_CONNECT_NOT_FOUND	201 The target AP is not found.
WIFI_REASON_CODE_CONNECT_TIMEOUT	202 Connect to AP timeout.

4.10.2.8 wifi_scan_method_t

enum `wifi_scan_method_t`

Enumerator

WIFI_FAST_SCAN	Do fast scan, scan will end after find SSID match AP
WIFI_ALL_CHANNEL_SCAN	All channel scan, scan will end after scan all the channel

4.10.2.9 wifi_scan_type_t

enum `wifi_scan_type_t`

This enumeration defines the wireless STA scan type.

Enumerator

WIFI_SCAN_TYPE_ACTIVE	Actively scan a network by sending 802.11 probe(s)
WIFI_SCAN_TYPE_PASSIVE	Passively scan a network by listening for beacons from APs
WIFI_SCAN_TYPE_MIX	Active + Passive scan

4.10.2.10 wifi_sort_method_t

enum `wifi_sort_method_t`

Enumerator

WIFI_CONNECT_AP_BY_SIGNAL	Sort match AP in scan list by RSSI
WIFI_CONNECT_AP_BY_SECURITY	Sort match AP in scan list by security mode

- uint8_t u8aSsid [IEEE80211_MAX_SSID_LEN+1]
- uint8_t u8Channel
- uint8_t u8MaxScanApNum
- uint8_t u8ResendCnt

5.85.1 Detailed Description

The parameter of MLME_CMD_SCAN

5.85.2 Field Documentation

5.85.2.1 ptScanReport

[scan_report_t](#)* ptScanReport

The scan report which filled by MSQ, report to APS

5.85.2.2 tScanType

E_WIFI_MLME_SCAN_TYPE tScanType

scan type. active, passive, or mix mode

5.85.2.3 u32ActiveScanDur

uint32_t u32ActiveScanDur

Scan duration per scan counter in channel. units: millisecond

5.85.2.4 u32PassiveScanDur

```
uint32_t u32PassiveScanDur
```

Scan duration per channel. units: millisecond

5.85.2.5 u8aBssid

```
uint8_t u8aBssid[MAC_ADDR_LEN]
```

Not supported yet. MAC address of AP

5.85.2.6 u8aSsid

```
uint8_t u8aSsid[IEEE80211_MAX_SSID_LEN+1]
```

Not supported yet. SSID of AP

5.85.2.7 u8Channel

```
uint8_t u8Channel
```

Only specific channel or scan all channels

5.85.2.8 u8MaxScanApNum

```
uint8_t u8MaxScanApNum
```

Max scan AP number. When scanned AP number over this value, MSQ will drop the AP with smallest RSSI value

5.85.2.9 u8ResendCnt

```
uint8_t u8ResendCnt
```

Send probe req counter per channel when active scan. After send probe req, it will wait active scan time, and then send next probe req. The total time will be increased by a factor of this value

5.86 scan_info_t Struct Reference

```

Data Fields

- [uint32_t max](#)
- [uint32_t min](#)

5.90.1 Detailed Description

Range of active scan times per channel.

5.90.2 Field Documentation

5.90.2.1 max

```
uint32_t max
```

maximum active scan time per channel, units: millisecond, maximum values 1500ms may cause station to disconnect from AP and are not recommended.

5.90.2.2 min

```
uint32_t min
```

minimum active scan time per channel, units: millisecond

5.91 wifi_ap_config_t Struct Reference

This structure is the Wi-Fi configuration for initialization for Soft-AP mode.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_auth_mode_t auth_mode](#)
- [uint16_t beacon_interval](#)
- [uint8_t channel](#)

- [uint8_t password_length](#)
- [uint8_t ssid \[WIFI_MAX_LENGTH_OF_SSID\]](#)
- [uint8_t ssid_hidden](#)
- [uint8_t ssid_length](#)

5.91.1 Detailed Description

This structure is the Wi-Fi configuration for initialization for Soft-AP mode.

5.91.2 Field Documentation

5.91.2.1 auth_mode

wifi_auth_mode_t auth_mode

The authentication mode.

5.91.2.2 beacon_interval

uint16_t beacon_interval

Beacon interval, 100 ~ 60000 ms, default 100 ms

5.91.2.3 channel

uint8_t channel

The channel of Soft-AP.

5.91.2.4 encrypt_type

wifi_cipher_type_t encrypt_type

The encryption mode.

5.91.2.5 max_connection

uint8_t max_connection

Max number of stations allowed to connect in, default 4, max 4

5.91.2.6 password

uint8_t password[WIFI_LENGTH_PASSPHRASE]

The password of the Soft-AP.

5.91.2.7 password_length

```
uint8_t password_length
```

The length of the password.

5.91.2.8 ssid

```
uint8_t ssid[WIFI_MAX_LENGTH_OF_SSID]
```

The SSID of the Soft-AP.

5.91.2.9 ssid_hidden

```
uint8_t ssid_hidden
```

Broadcast SSID or not, default 0, broadcast the SSID

5.91.2.10 ssid_length

```
uint8_t ssid_length
```

The length of the SSID.

5.92 wifi_auto_connect_info_t Struct Reference

This structure is the Wi-Fi auto connect for save in the flash (FIM).

```
#include <wifi_types.h>
```

Data Fields

- `uint8_t ap_channel`
- `uint16_t beacon_interval`
- `uint8_t bssid [WIFI_MAC_ADDRESS_LENGTH]`
- `uint16_t capabilities`
- `uint8_t dtim_prod`

- uint8_t [number](#)
- uint8_t [scan_id](#)
- uint32_t [status](#)

5.99.1 Detailed Description

[wifi_event_sta_scan_done_t](#)

5.99.2 Field Documentation

5.99.2.1 number

`uint8_t number`

5.99.2.2 scan_id

`uint8_t scan_id`

5.99.2.3 status

`uint32_t status`

status of scanning APs

5.100 wifi_evt_t Struct Reference

```
#include <controller_wifi.h>
```

Data Fields

- `uint32_t` [evt_type](#)
- `void *` [prvData](#)

5.100.1 Field Documentation

5.100.1.1 evt_type

`uint32_t evt_type`

5.100.1.2 prvData

`void* prvData`

5.101 wifi_fast_scan_threshold_t Struct Reference

Structure describing parameters for a Wi-Fi fast scan.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_auth_mode_t authmode](#)
- [int8_t rssi](#)

5.101.1 Detailed Description

Structure describing parameters for a Wi-Fi fast scan.

5.101.2 Field Documentation

5.101.2.1 authmode

```
wifi_auth_mode_t authmode
```

The weakest authmode to accept in the fast scan mode

5.101.2.2 rssi

```
int8_t rssi
```

The minimum rssi to accept in the fast scan mode

5.102 wifi_init_config_t Struct Reference

WiFi stack configuration parameters.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_event_notify_cb_t event_handler](#)
- [int magic](#)

5.102.1 Detailed Description

WiFi stack configuration parameters.

5.102.2 Field Documentation

5.102.2.1 event_handler

`wifi_event_notify_cb_t` event_handler

WiFi event handler

5.102.2.2 magic

`int` magic

WiFi init magic number, it should be the last field

5.103 wifi_scan_config_t Struct Reference

Parameters for an SSID scan.

```
#include <wifi_types.h>
```

Data Fields

- `uint8_t` * `bssid`
- `uint8_t` `channel`
- `wifi_scan_time_t` `scan_time`
- `wifi_scan_type_t` `scan_type`
- `bool` `show_hidden`
- `uint8_t` * `ssid`

5.103.1 Detailed Description

Parameters for an SSID scan.

5.103.2 Field Documentation

5.103.2.1 bssid

`uint8_t* bssid`

MAC address of AP

5.103.2.2 channel

`uint8_t channel`

channel, scan the specific channel

5.103.2.3 scan_time

`wifi_scan_time_t scan_time`

scan time per channel

5.103.2.4 scan_type

`wifi_scan_type_t scan_type`

scan type, active or passive

5.103.2.5 show_hidden

`bool show_hidden`

enable to scan AP whose SSID is hidden

5.103.2.6 ssid

`uint8_t* ssid`

SSID of AP

5.104 wifi_scan_info_t Struct Reference

This structure defines the information of scanned APs.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_auth_mode_t](#) `auth_mode`
- `uint16_t` `beacon_interval`
- `uint8_t` `bssid` [[WIFI_MAC_ADDRESS_LENGTH](#)]
- `uint16_t` `capability_info`
- `uint8_t` `channel`
- `uint8_t` `dtim_period`
- [wifi_cipher_type_t](#) `group_cipher`
- [wifi_cipher_type_t](#) `pairwise_cipher`
- `int` `rsi`
- `uint8_t` `ssid` [[WIFI_MAX_LENGTH_OF_SSID](#)]
- `uint8_t` `ssid_length`

5.104.1 Detailed Description

This structure defines the information of scanned APs.

5.104.2 Field Documentation

5.104.2.1 `auth_mode`

`wifi_auth_mode_t` `auth_mode`

Please refer to the definition of [wifi_auth_mode_t](#).

5.104.2.2 `beacon_interval`

`uint16_t` `beacon_interval`

Indicates the beacon interval.

5.104.2.3 `bssid`

`uint8_t` `bssid` [[WIFI_MAC_ADDRESS_LENGTH](#)]

AP's MAC address.

5.104.2.4 `capability_info`

`uint16_t` `capability_info`

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

5.104.2.5 channel

uint8_t channel

The channel used.

5.104.2.6 dtim_period

uint8_t dtim_period

The DTIM Period indicates the number of beacon intervals between successive DTIMs. If all TIMs are DTIMs, the DTIM Period field has the value 1.

5.104.2.7 group_cipher

wifi_cipher_type_t group_cipher

group cipher of AP

5.104.2.8 pairwise_cipher

wifi_cipher_type_t pairwise_cipher

pairwise cipher of AP, Please refer to the definition of #wifi_encrypt_type_t.

5.104.2.9 rssi

int rssi

Records the RSSI value when probe response is received.

5.104.2.10 ssid

uint8_t ssid[WIFI_MAX_LENGTH_OF_SSID]

Stores the predefined SSID.

5.104.2.11 ssid_length

uint8_t ssid_length

Length of the SSID.

5.105 wifi_scan_list_t Struct Reference

This structure defines the list of scanned APs with their corresponding information.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_scan_info_t](#) `ap_record` [`WIFI_MAX_SCAN_AP_NUM`]
- `int` `num`

5.105.1 Detailed Description

This structure defines the list of scanned APs with their corresponding information.

5.105.2 Field Documentation

5.105.2.1 `ap_record`

```
wifi_scan_info_t ap_record[WIFI_MAX_SCAN_AP_NUM]
```

The information about an AP obtained through the scan result is stored

5.105.2.2 `num`

```
int num
```

number of AP in the list

5.106 wifi_scan_time_t Union Reference

Aggregate of active & passive scan time per channel.

```
#include <wifi_types.h>
```

Data Fields

- [wifi_active_scan_time_t](#) `active`
- `uint32_t` `passive`

5.106.1 Detailed Description

Aggregate of active & passive scan time per channel.

5.106.2 Field Documentation

5.106.2.1 active

wifi_active_scan_time_t active

active scan time per channel, units: millisecond.

5.106.2.2 passive

uint32_t passive

passive scan time per channel, units: millisecond, maximum values 1500ms may cause station to disconnect from AP and are not recommended.

5.107 wifi_sta_config_t Struct Reference

This structure is the Wi-Fi configuration for initialization for STA mode.

```
#include <wifi_types.h>
```

Data Fields

- uint8_t bssid [WIFI_MAC_ADDRESS_LENGTH]
- uint8_t bssid_present
- uint8_t password [WIFI_LENGTH_PASSPHRASE]
- uint8_t password_length
- wifi_scan_method_t scan_method
- wifi_sort_method_t sort_method
- uint8_t ssid [WIFI_MAX_LENGTH_OF_SSID]
- uint8_t ssid_length
- wifi_fast_scan_threshold_t threshold

5.107.1 Detailed Description

This structure is the Wi-Fi configuration for initialization for STA mode.

5.107.2 Field Documentation

5.107.2.1 bssid

```
uint8_t bssid[WIFI_MAC_ADDRESS_LENGTH]
```

The MAC address of the target AP.

5.107.2.2 bssid_present

```
uint8_t bssid_present
```

The BSSID is present if it is set to 1. Otherwise, it is set to 0.

5.107.2.3 password

```
uint8_t password[WIFI_LENGTH_PASSPHRASE]
```

The password of the target AP.

5.107.2.4 password_length

```
uint8_t password_length
```

The length of the password. If the length is 64, the password is regarded as PMK.

5.107.2.5 scan_method

```
wifi_scan_method_t scan_method
```

do all channel scan or fast scan

5.107.2.6 sort_method

```
wifi_sort_method_t sort_method
```

sort the connect AP in the list by rssi or security mode

5.107.2.7 ssid

```
uint8_t ssid[WIFI_MAX_LENGTH_OF_SSID]
```

The SSID of the target AP.

5.107.2.8 ssid_length

```
uint8_t ssid_length
```

The length of the SSID.

5.107.2.9 threshold

```
wifi_fast_scan_threshold_t threshold
```

When scan_method is set to WIFI_FAST_SCAN, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

5.108 wifi_wpa_ie_data_t Struct Reference

This structure is the Wi-Fi auto connect with wpa information for save in the flash (FIM).

```
#include <wifi_types.h>
```

Data Fields

- int capabilities
- int group_cipher
- int key_mgmt
- int mgmt_group_cipher
- uint32_t num_pmkid
- int pairwise_cipher
- const uint8_t * pmkid
- int proto

5.108.1 Detailed Description

This structure is the Wi-Fi auto connect with wpa information for save in the flash (FIM).

5.108.2 Field Documentation

5.108.2.1 capabilities

```
int capabilities
```

5.108.2.2 group_cipher

```
int group_cipher
```

5.108.2.3 key_mgmt

```
int key_mgmt
```

5.108.2.4 mgmt_group_cipher

```
int mgmt_group_cipher
```

5.108.2.5 num_pmkid

```
uint32_t num_pmkid
```

5.108.2.6 pairwise_cipher

```
int pairwise_cipher
```

5.108.2.7 pmkid

```
const uint8_t* pmkid
```

5.108.2.8 proto

```
int proto
```
